X3

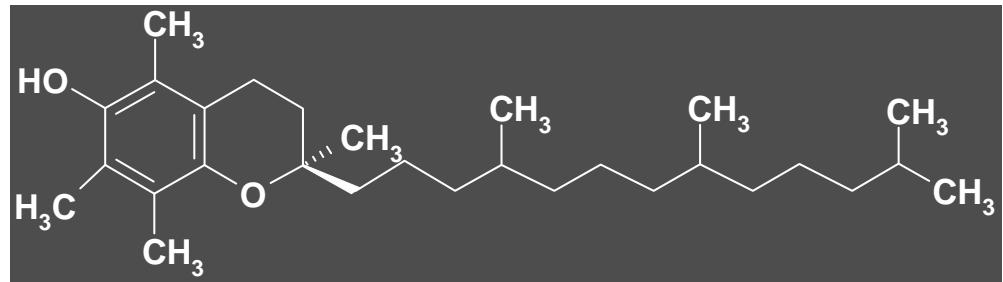

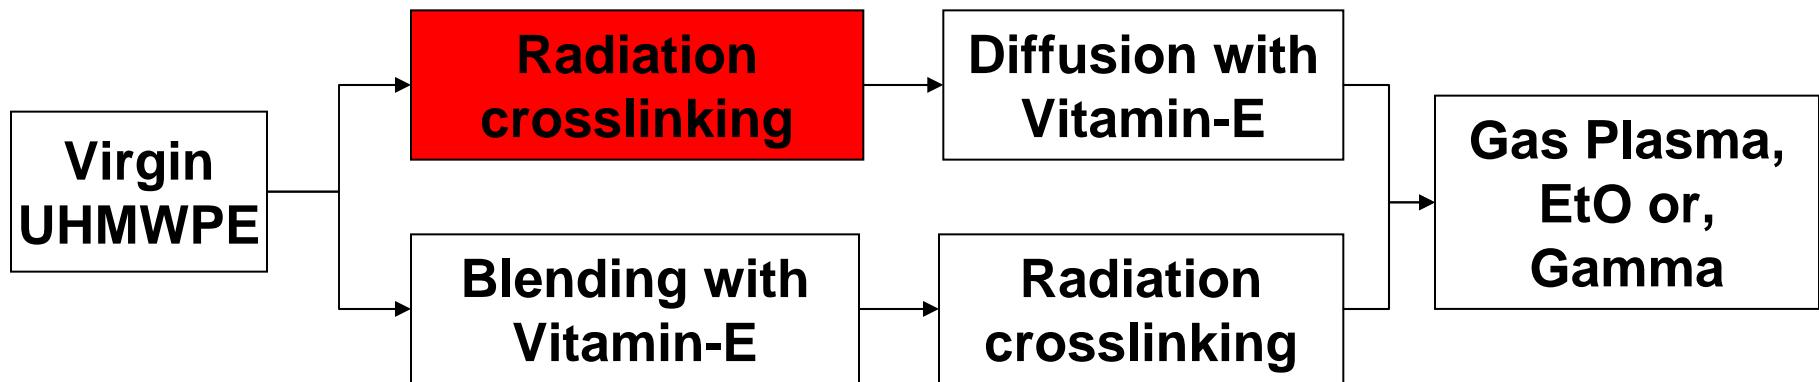

Vitamin-E

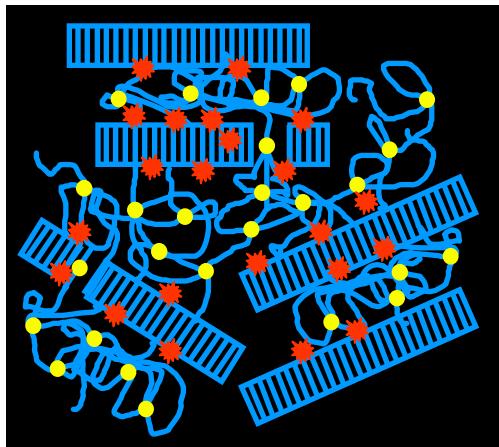

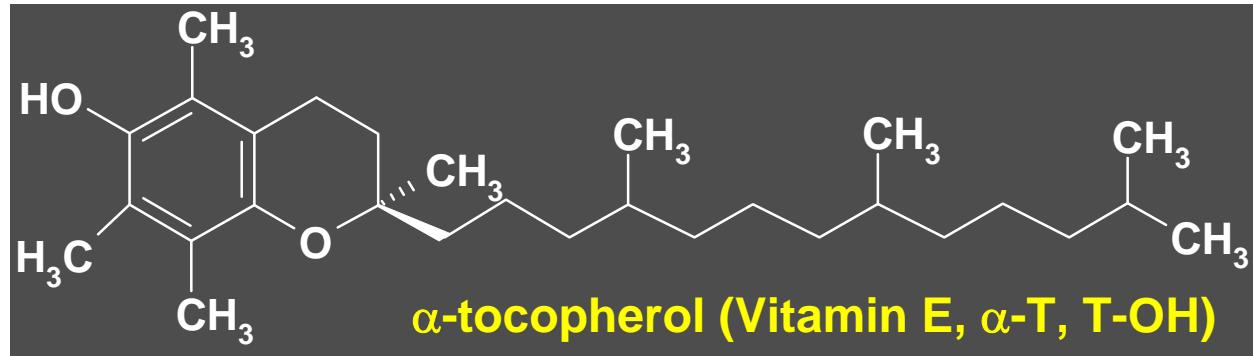

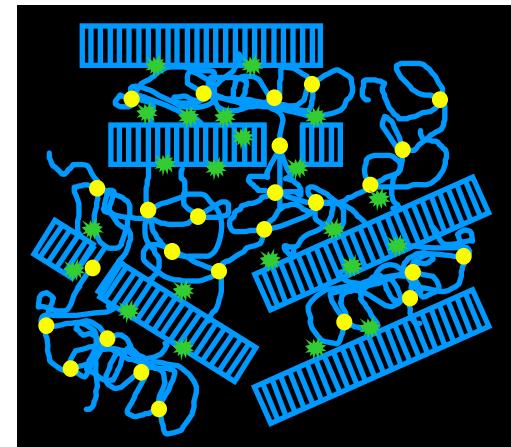

Vitamin-E

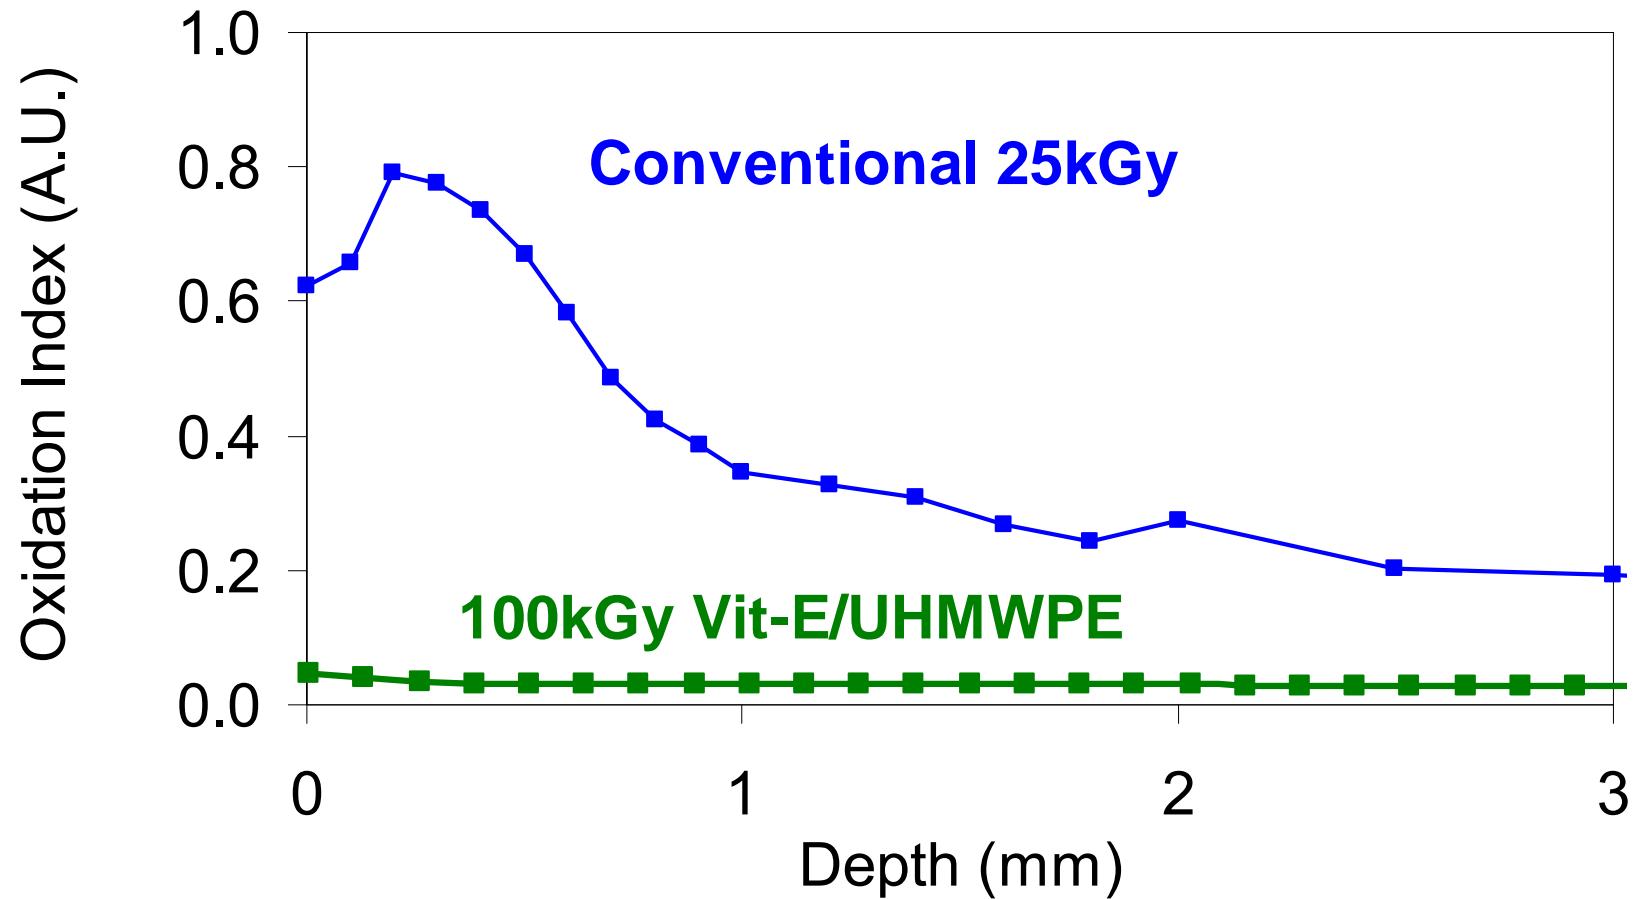

Vitamin-E Stabilization of Free Radicals

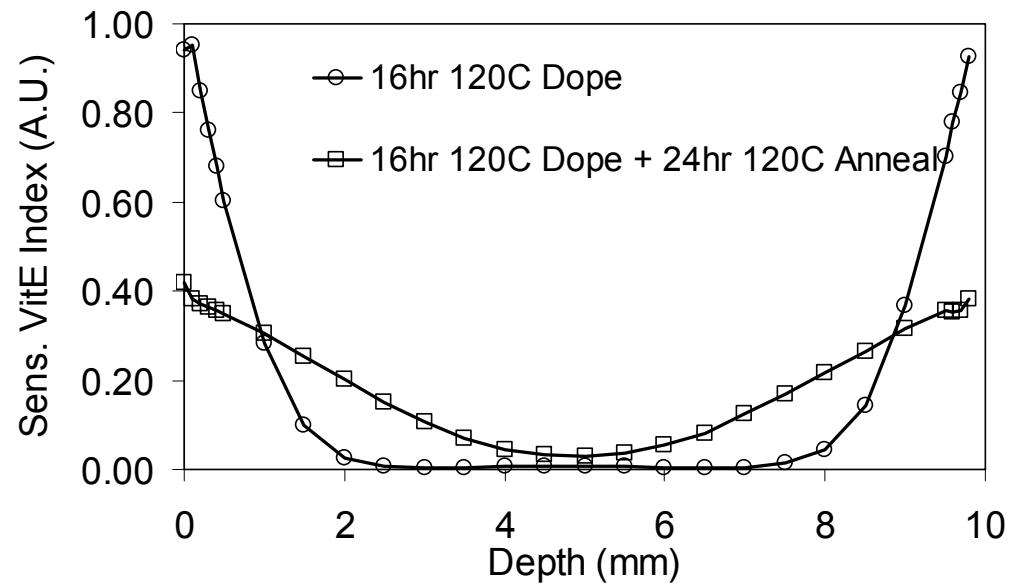

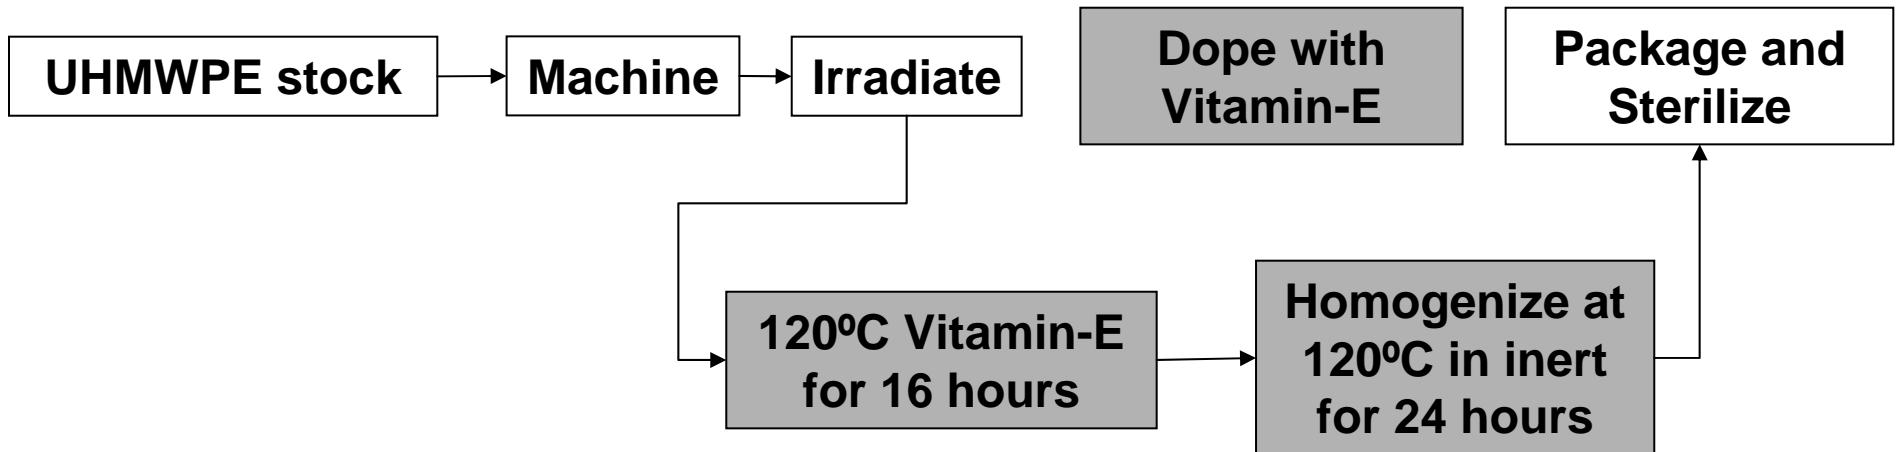

+ Vitamin-E

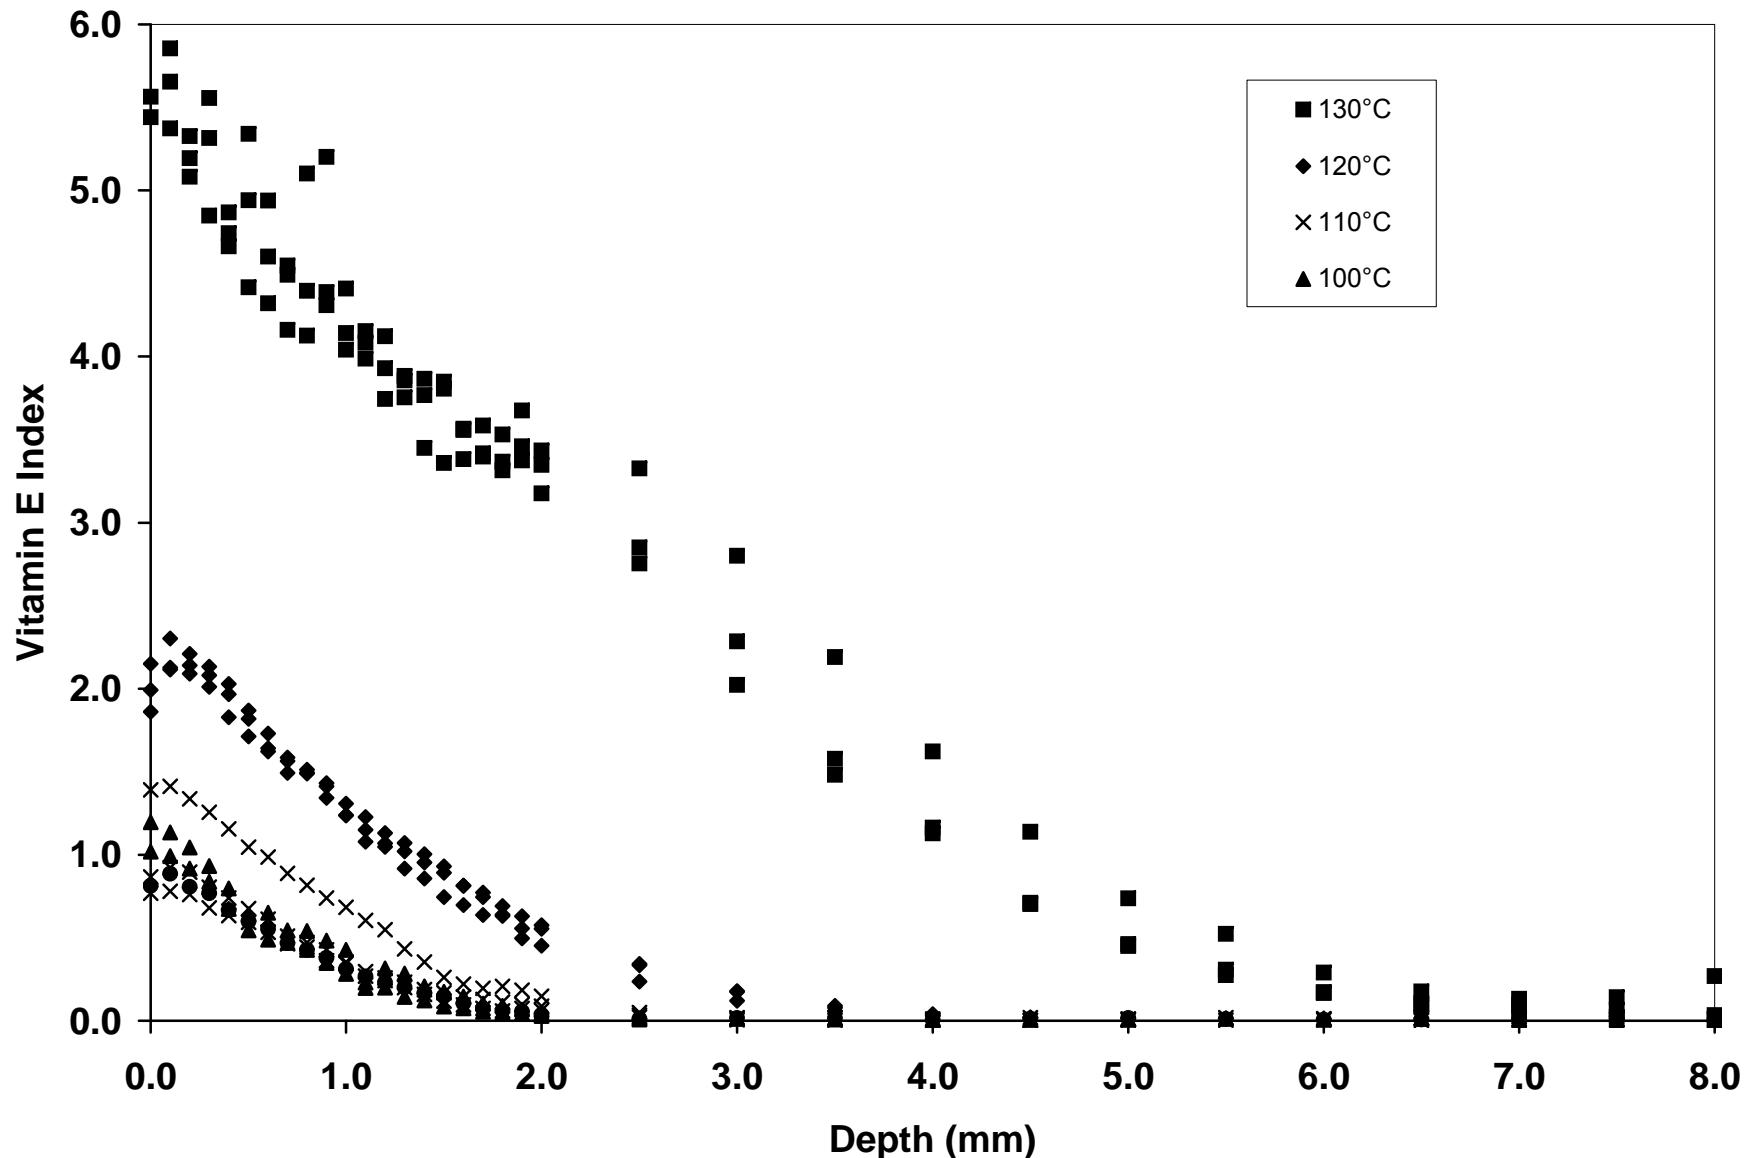

Accelerated Aging of Vit-E/UHMWPE

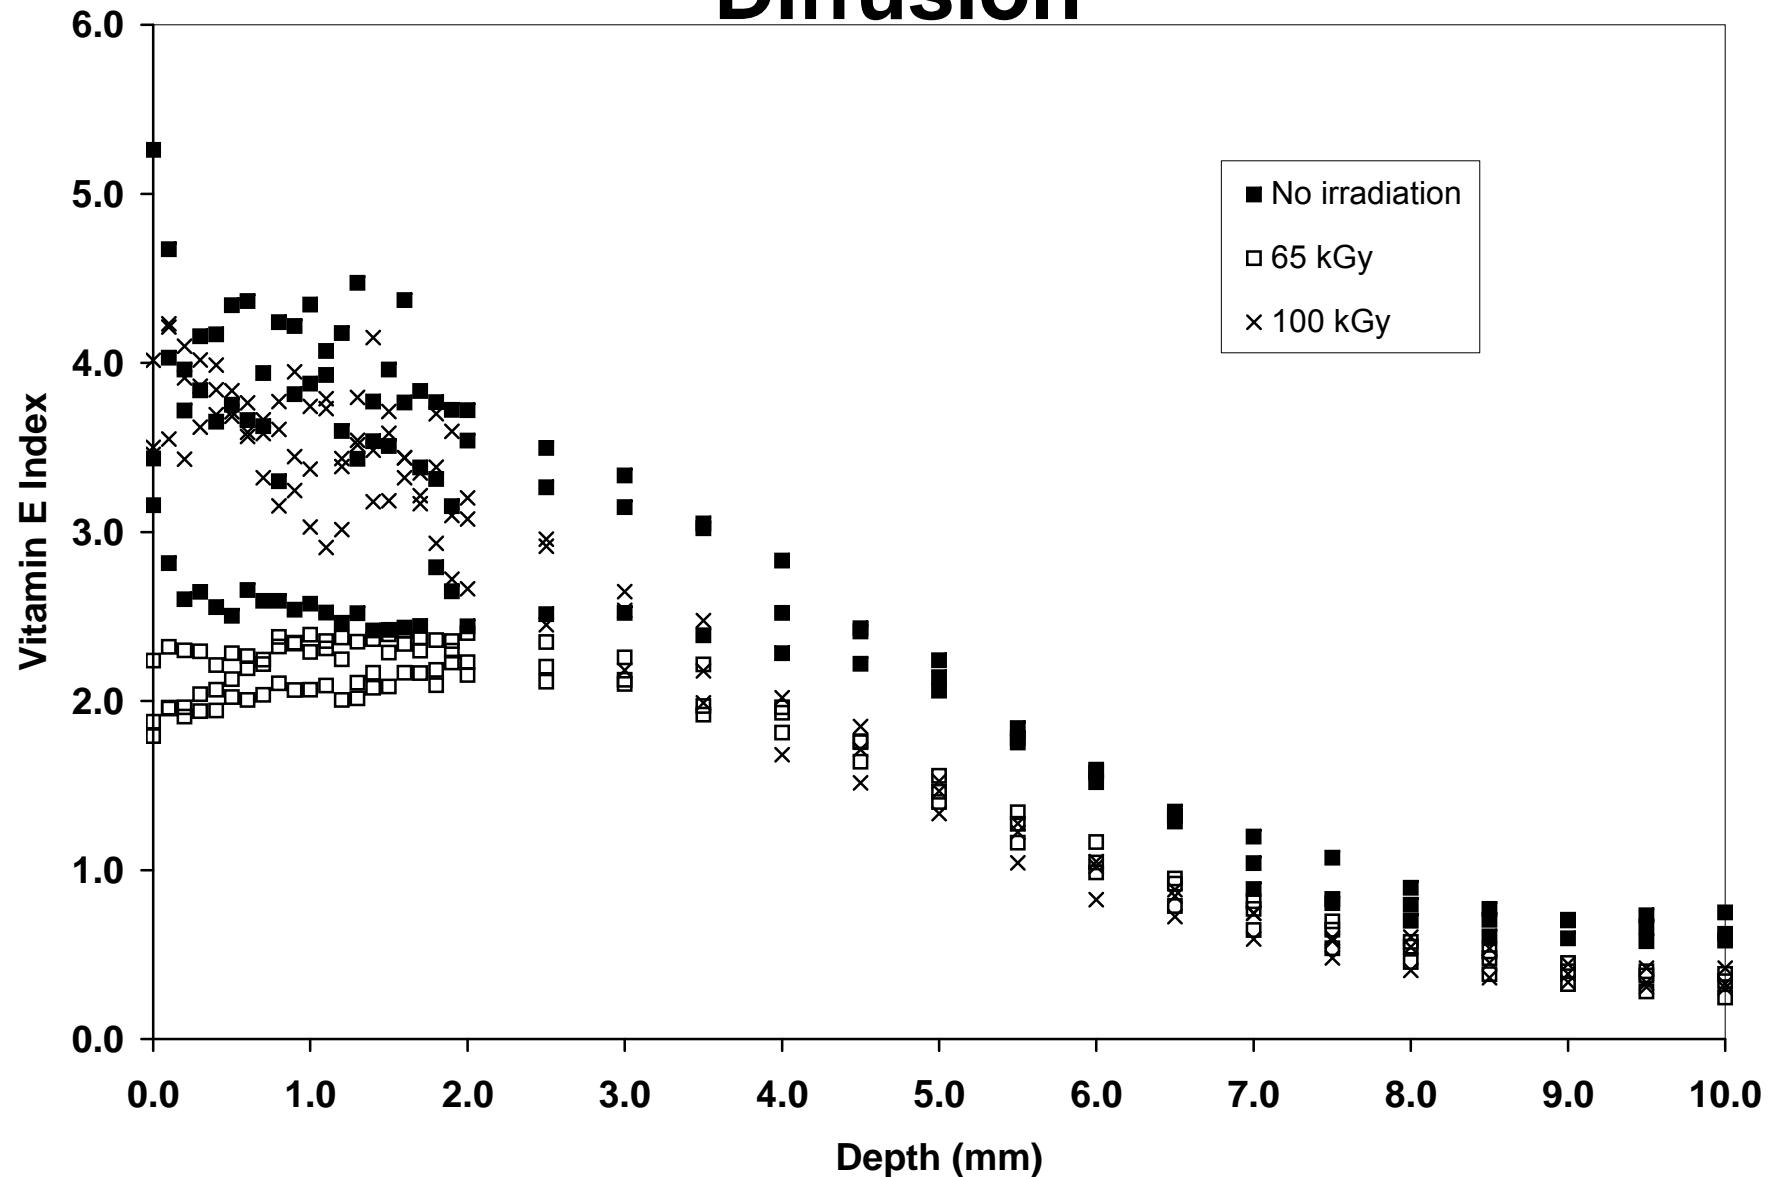

Manufacturing Scenario

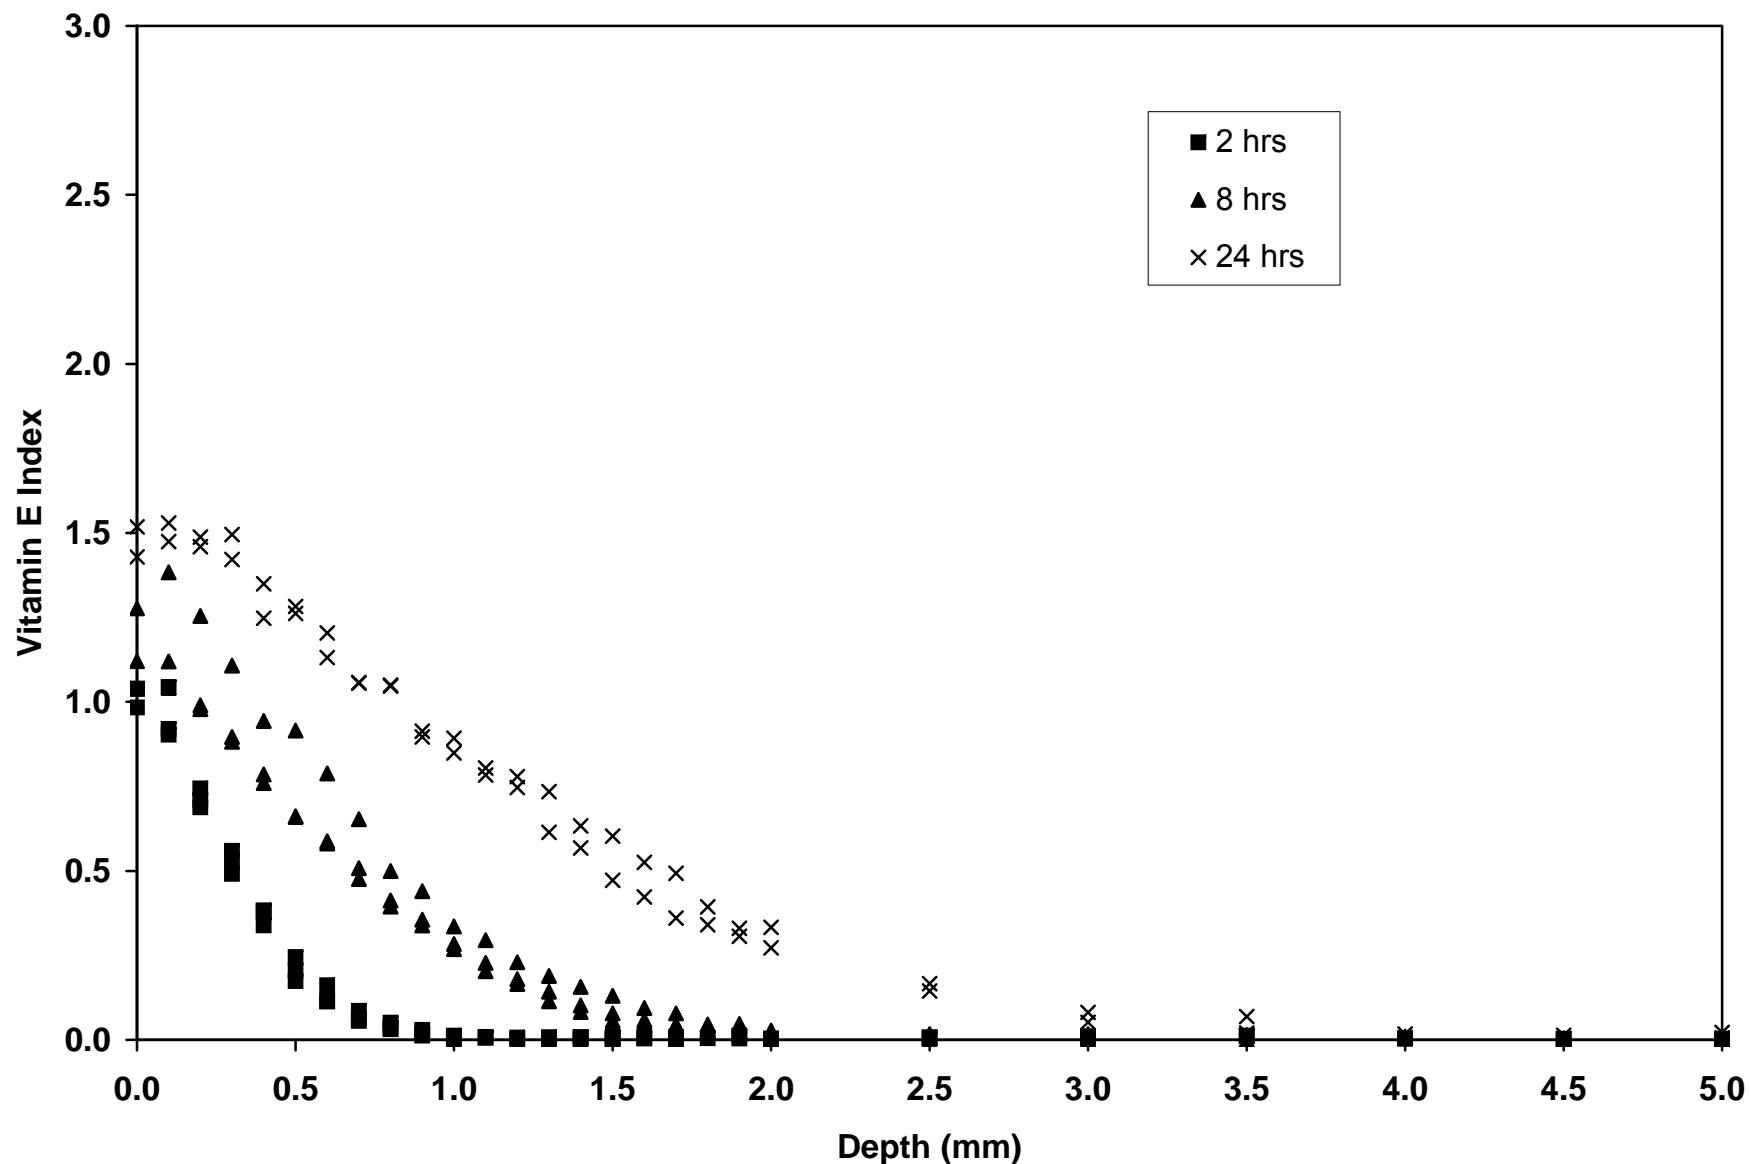

Effect of Temperature on Vitamin-E Diffusion (virgin UHMWPE)

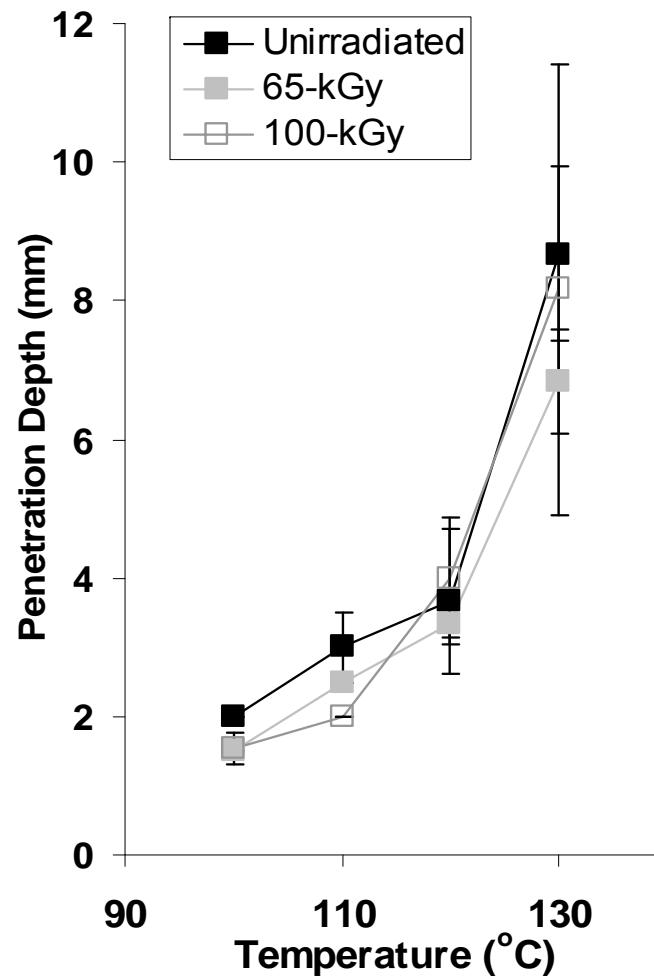

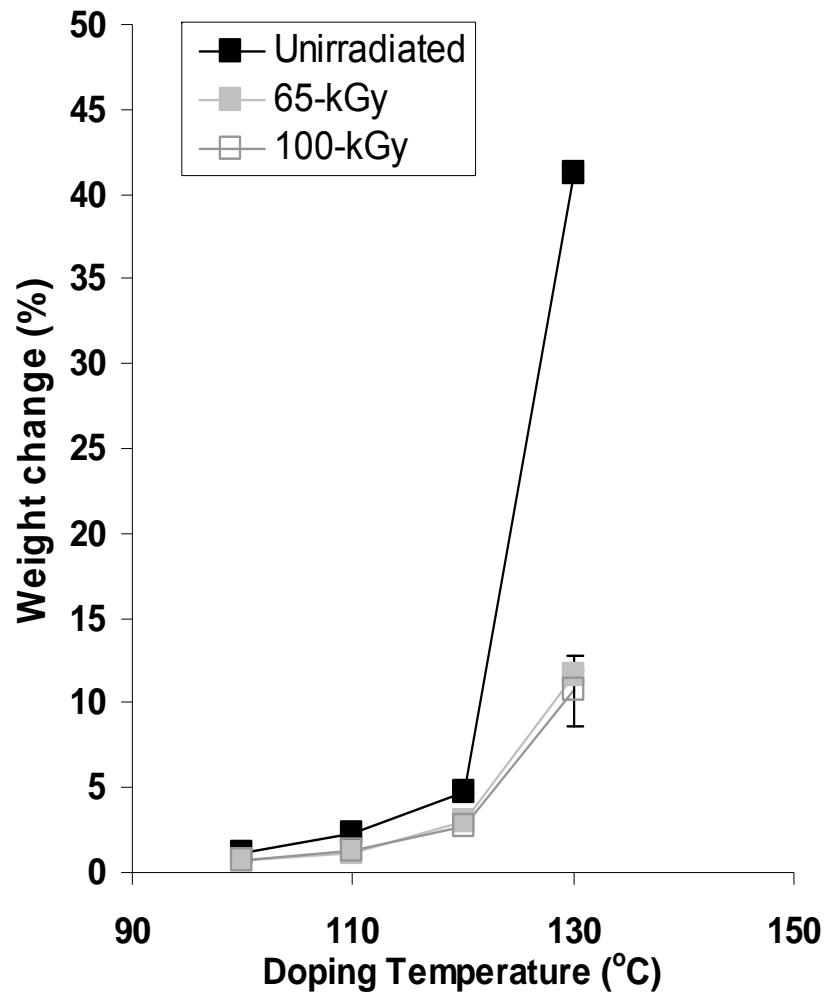

Effect of Radiation Dose on Vitamin-E Diffusion

Effect of time on Vitamin-E Diffusion – (100kGy UHMWPE at 120C)

24 h Doping – Weight Change vs. Temperature

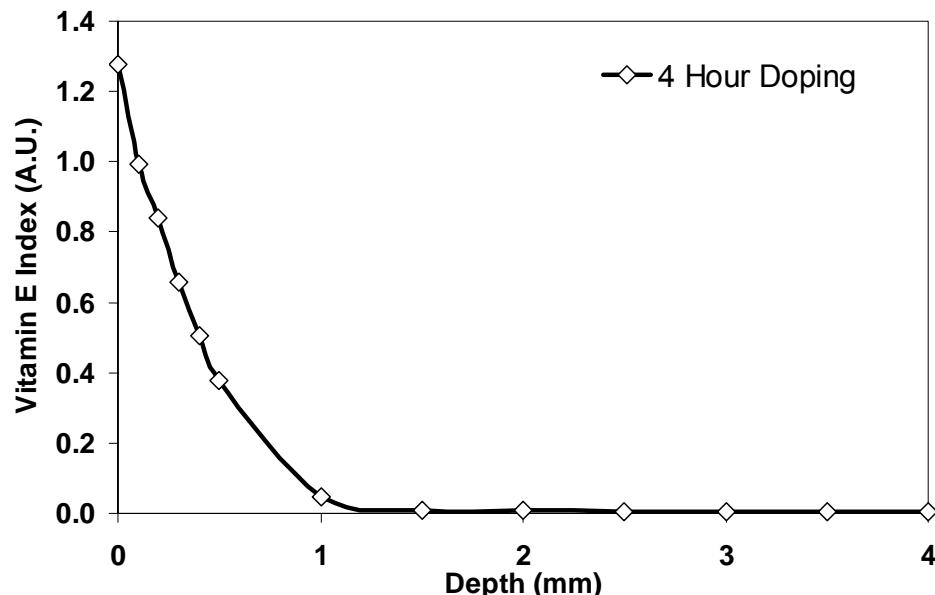

Diffusion Model

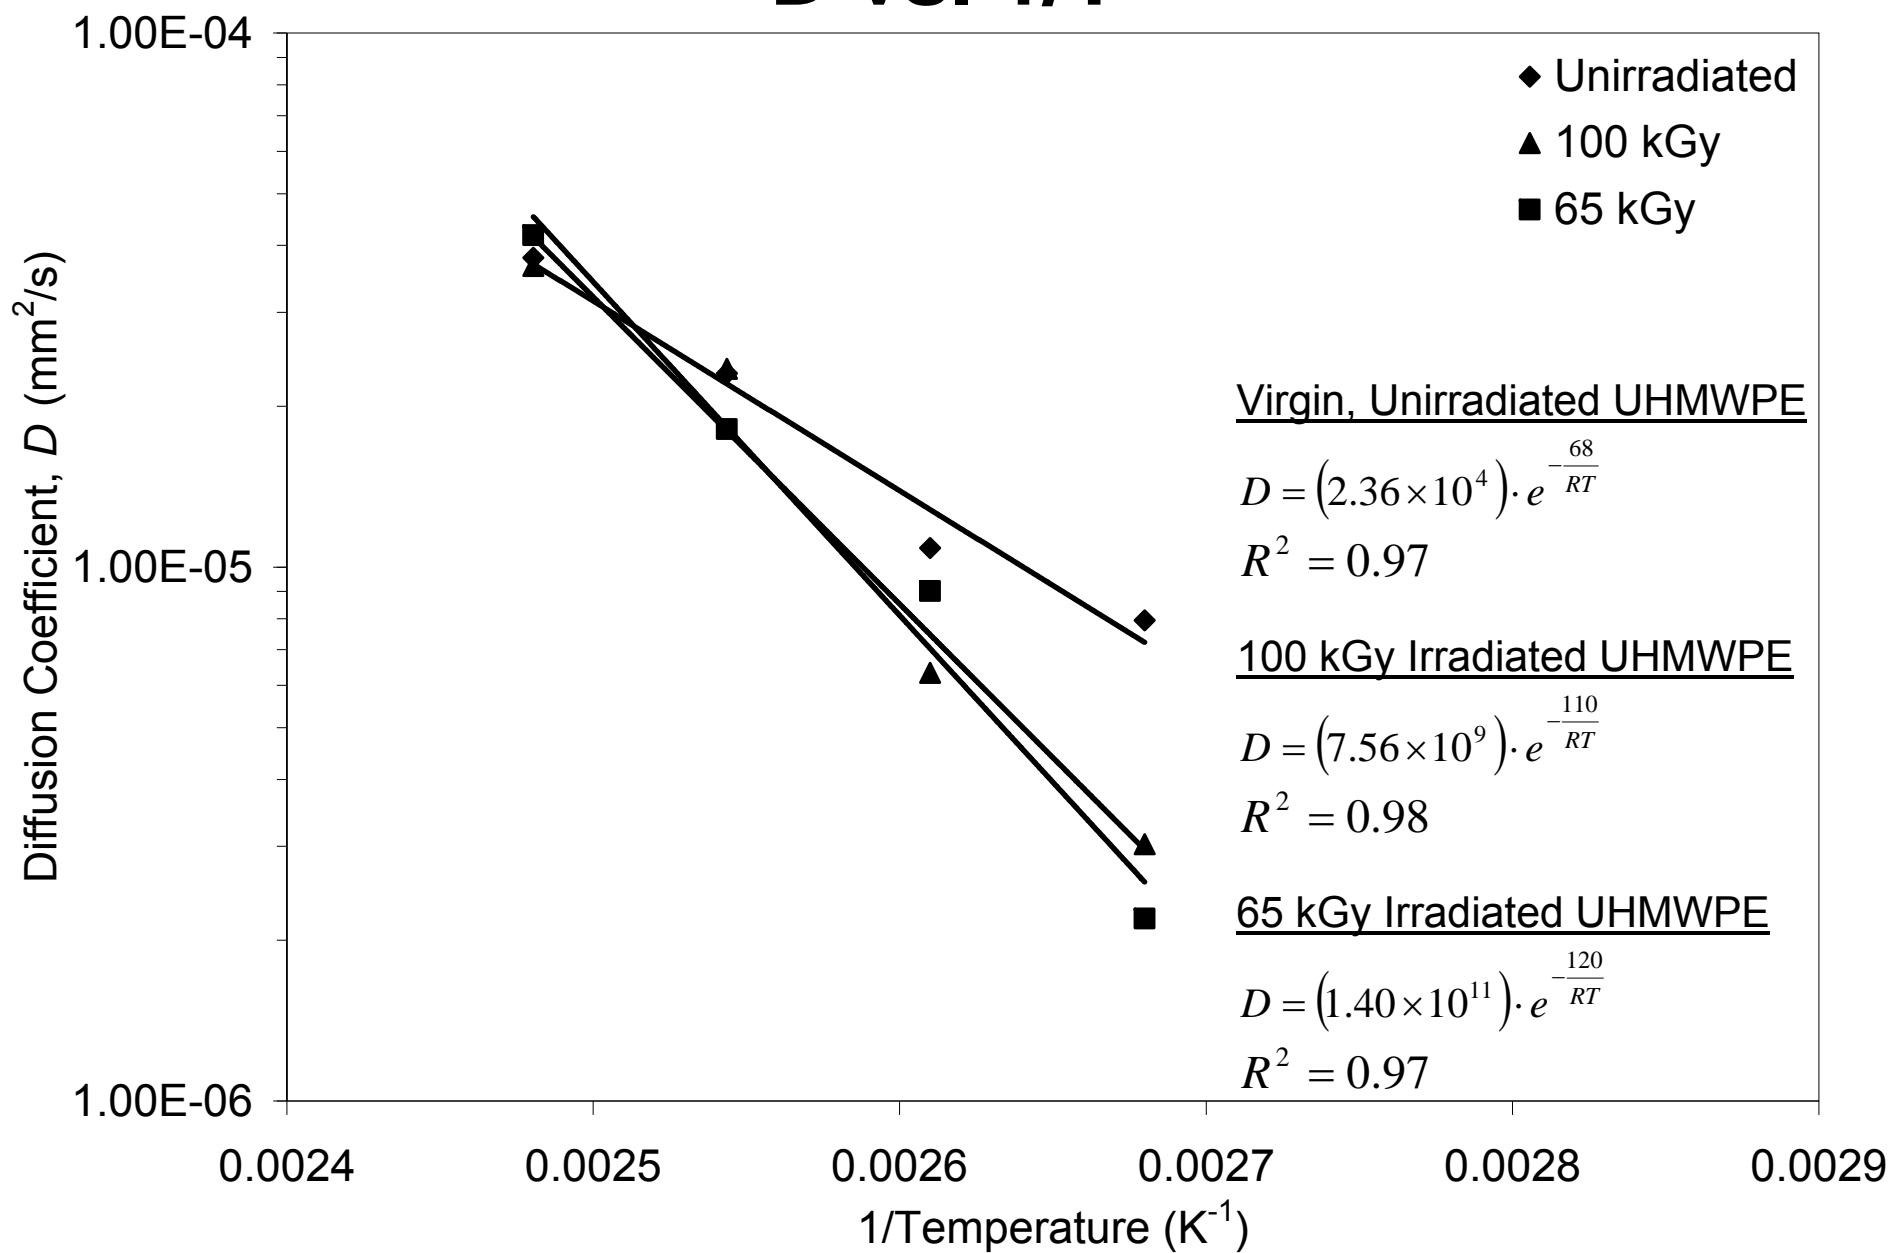

assume Fick's 2nd Law for diffusion

$$C(x, t) = C_0 \cdot erfc\left(\frac{x}{2\sqrt{Dt}}\right)$$

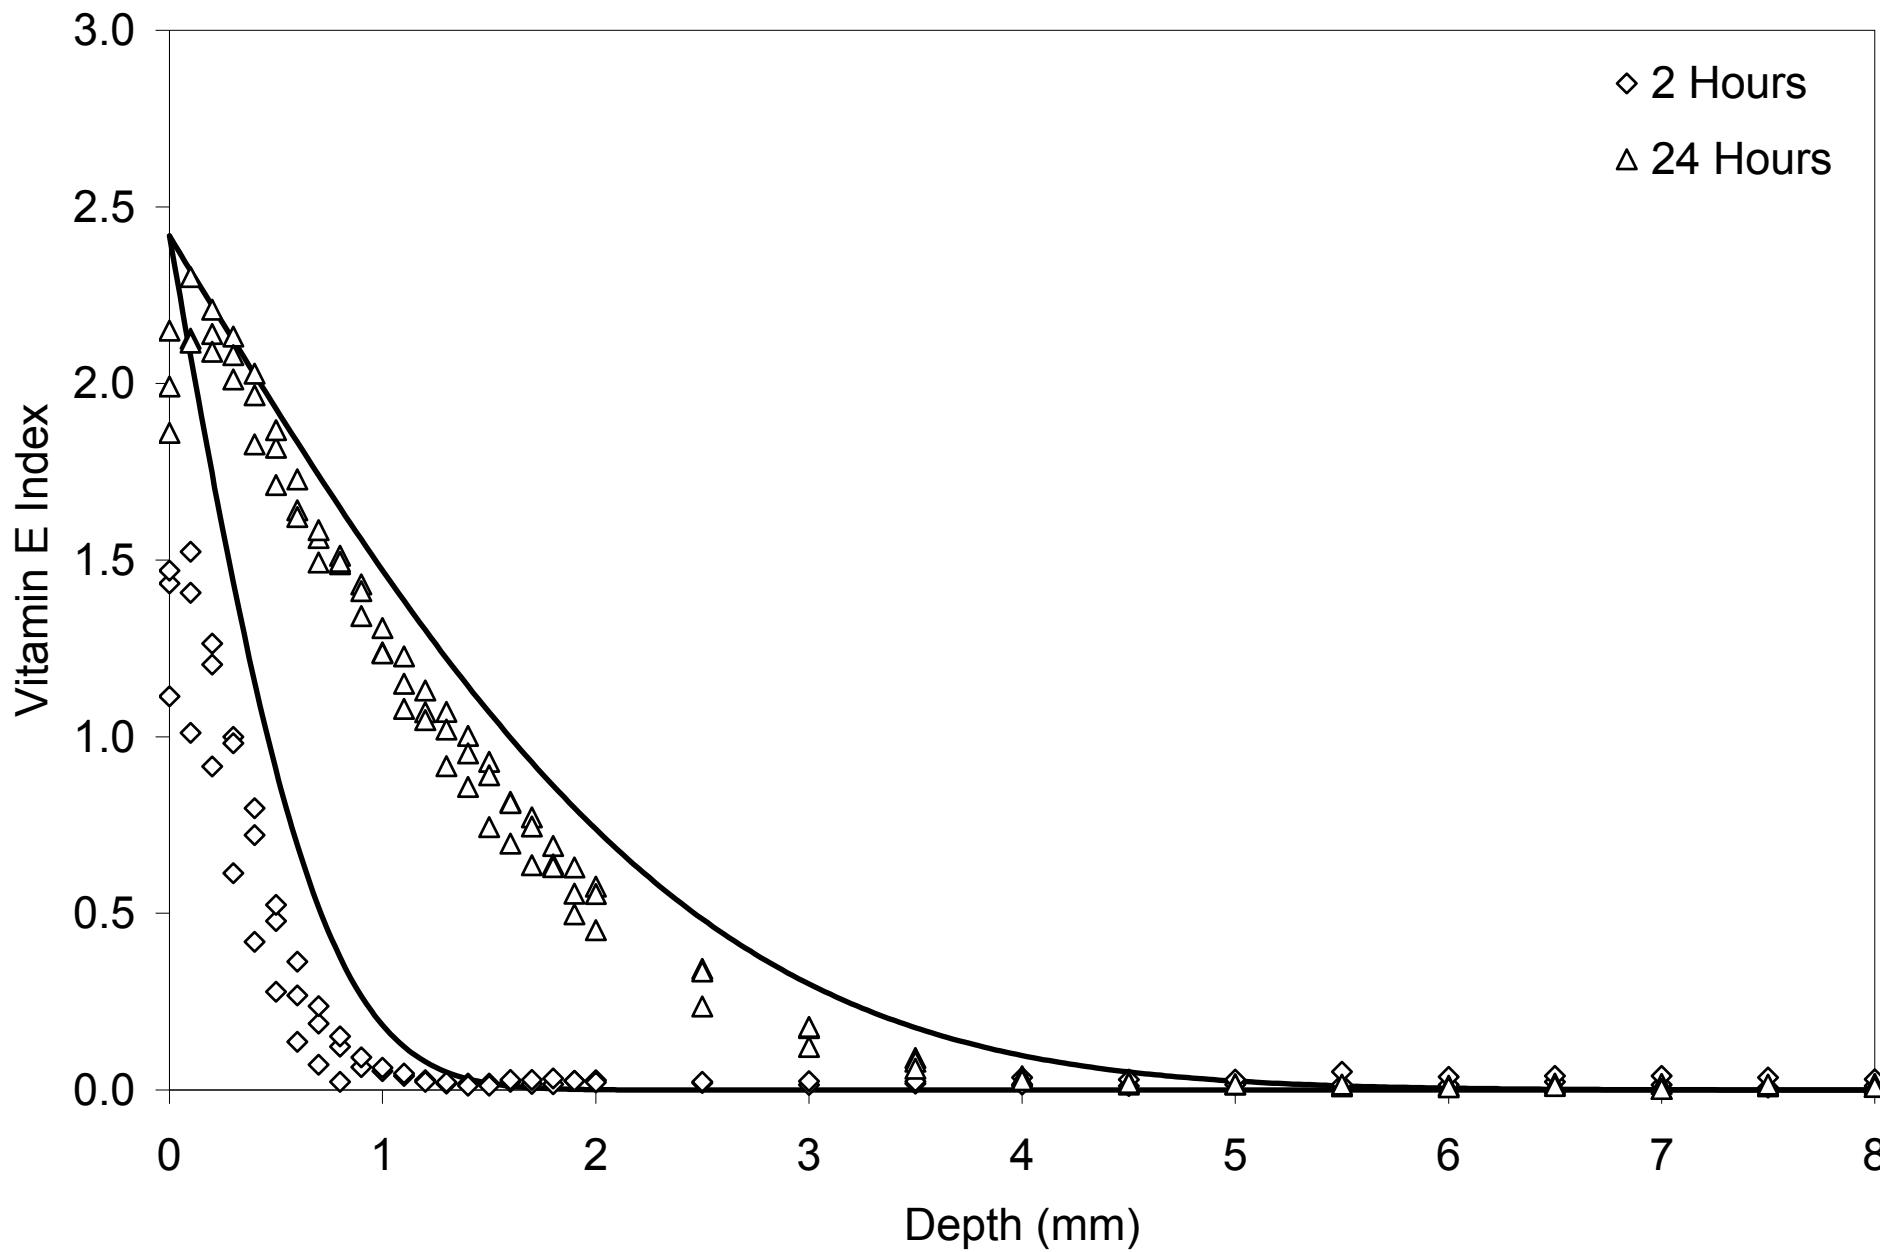

$$D = D_0 \cdot e^{-\frac{Q}{RT}}$$

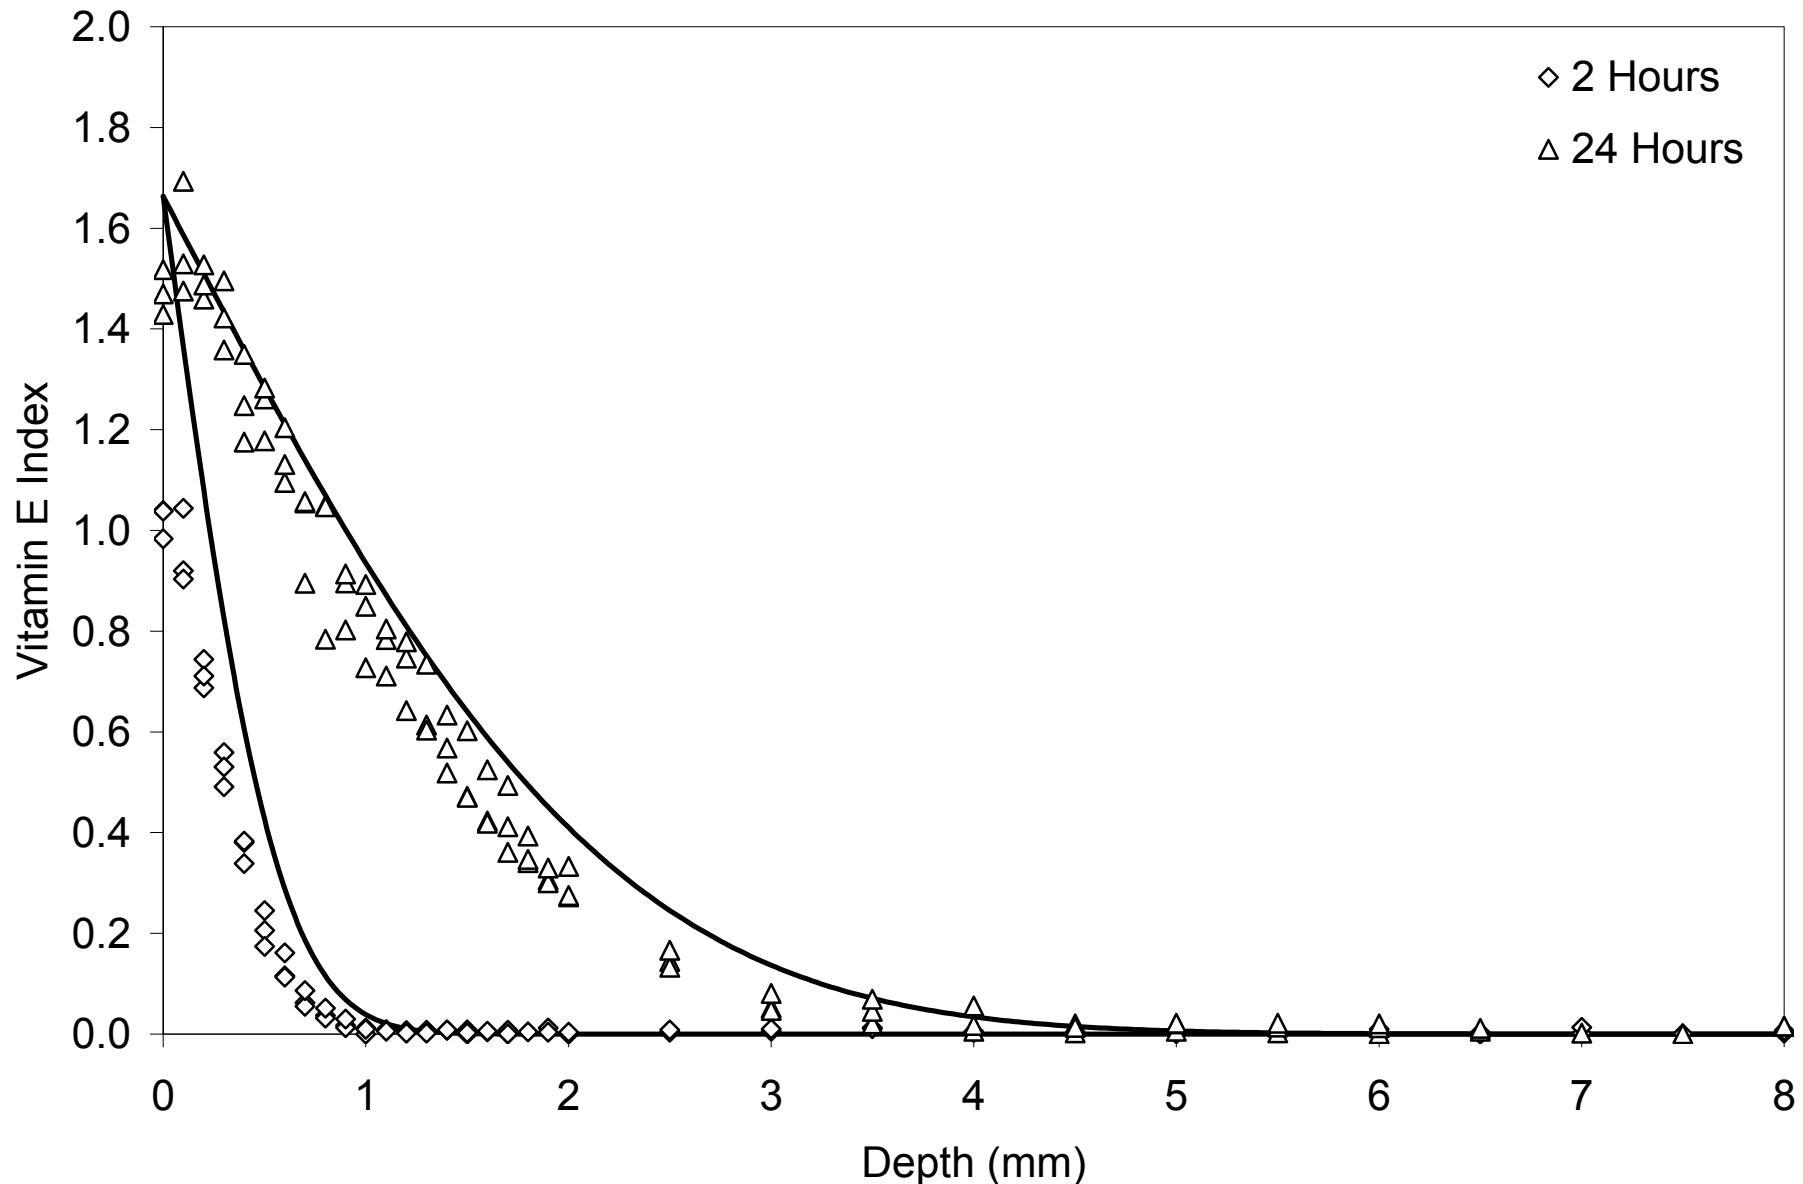

D vs. 1/T

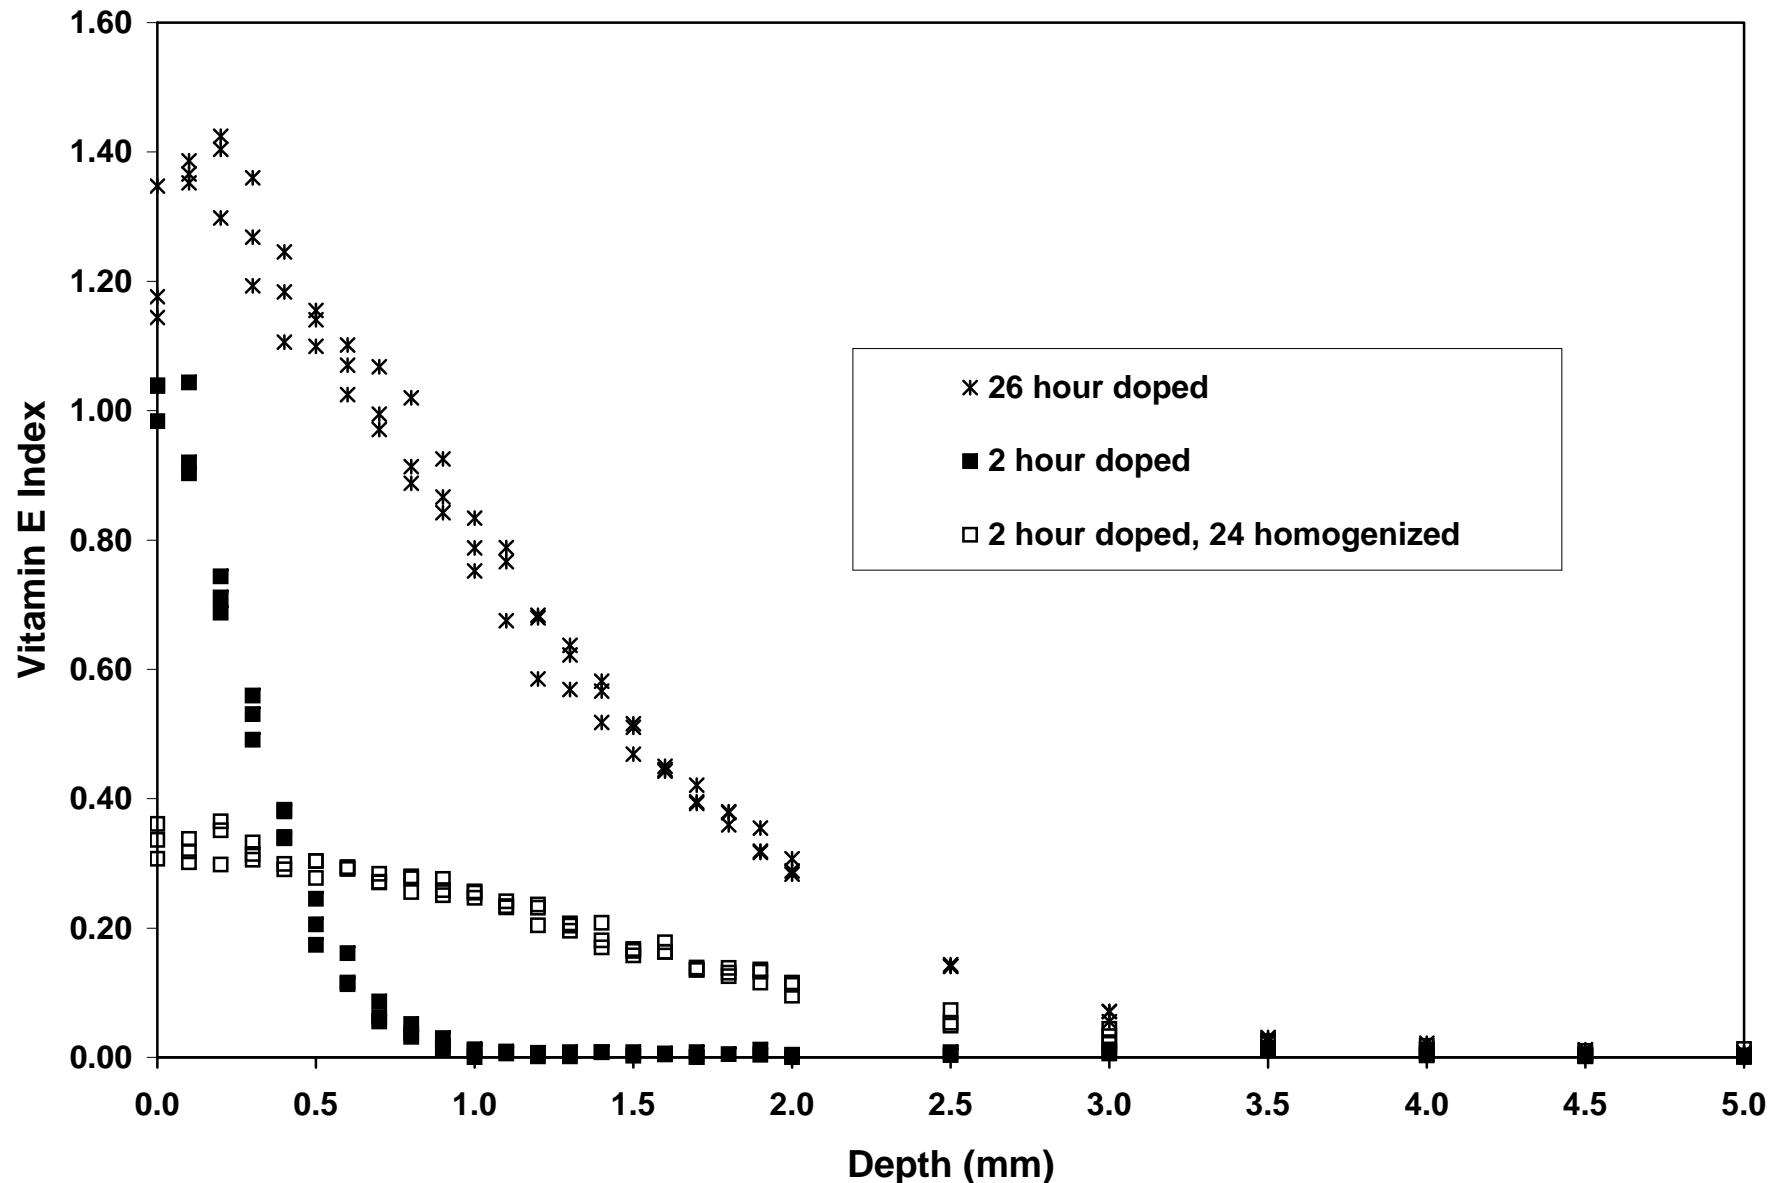

Virgin UHMWPE at 120°C

100kGy UHMWPE 100°C

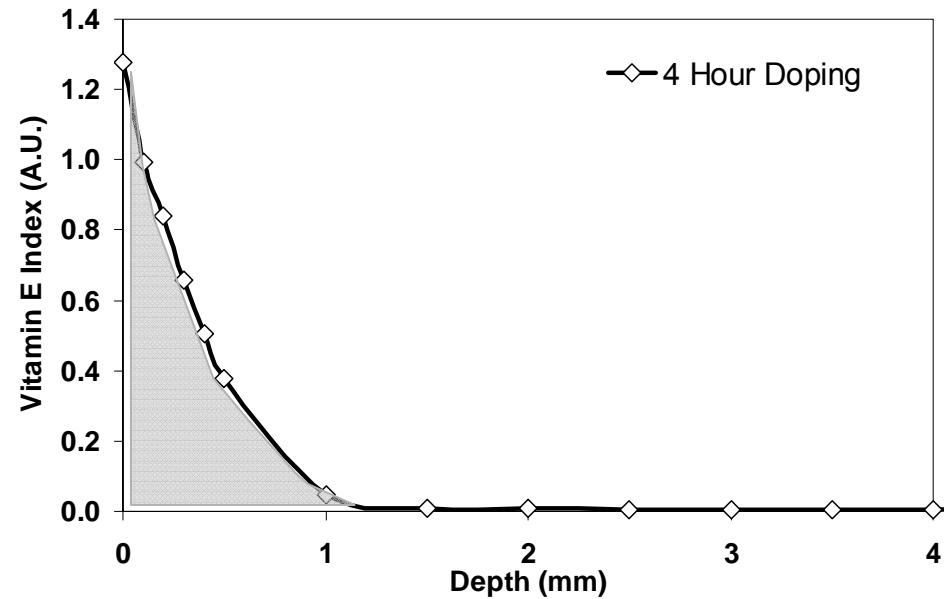

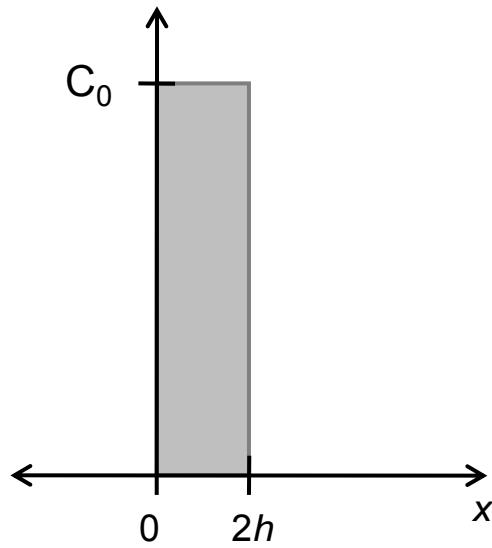

Effect of Homogenization on 100kGy UHMWPE at 120°C

modeled homogenization as thin film of α -tocopherol diffusing into a semi-infinite UHMWPE medium

$$C(x,t) = \left(\frac{C_0}{2} \right) \cdot \left[\operatorname{erf} \left(\frac{h-x}{2\sqrt{Dt}} \right) + \operatorname{erf} \left(\frac{h+x}{2\sqrt{Dt}} \right) \right]$$

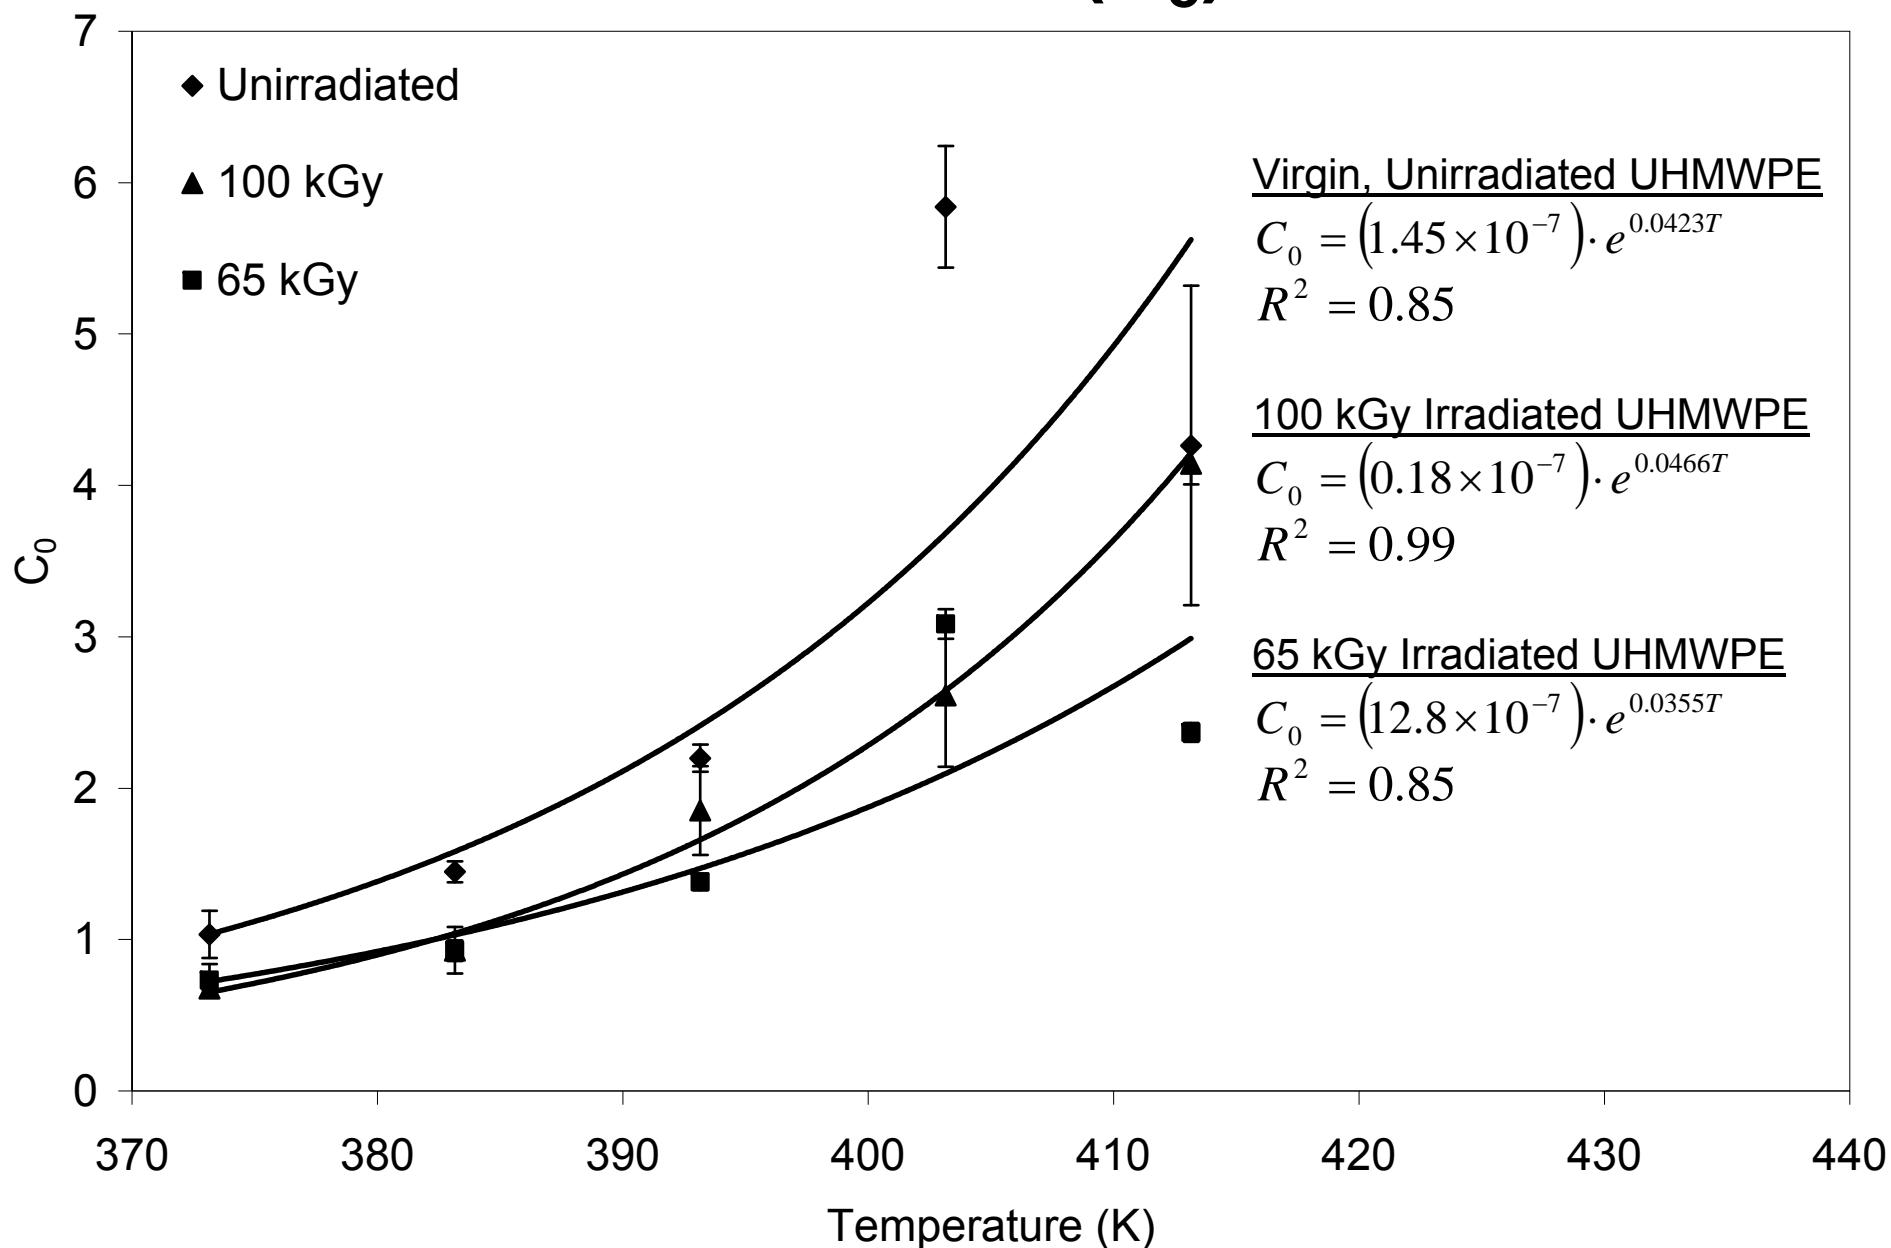

vitE did not elute out during homogenization, assumed that there was an impermeable barrier at depth $x = 0$

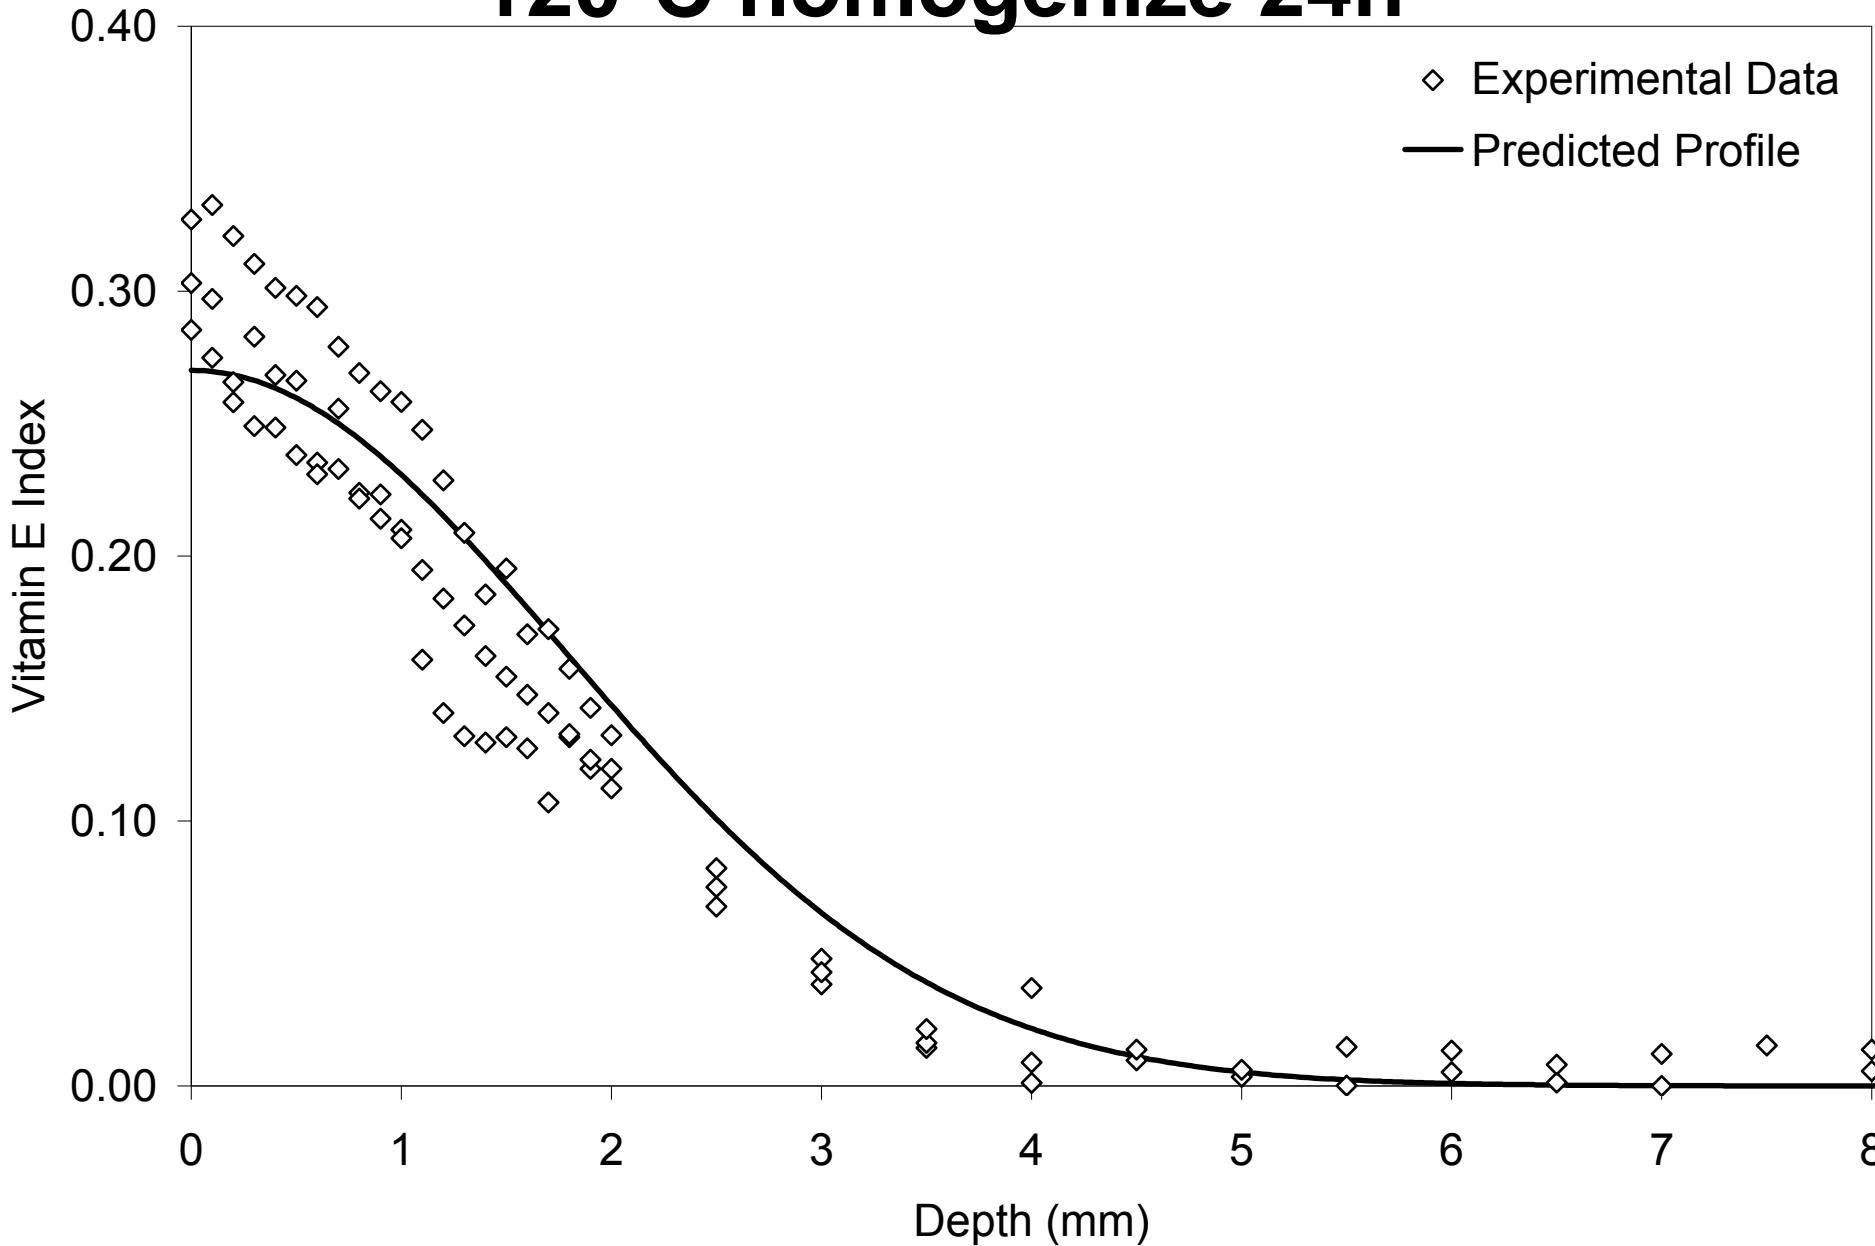

$$C(x,t) = C_0 \cdot \left[\operatorname{erf} \left(\frac{h-x}{2\sqrt{Dt}} \right) + \operatorname{erf} \left(\frac{h+x}{2\sqrt{Dt}} \right) \right]$$

$$2h = \left(\frac{1}{C_0} \right) \cdot \int_0^{\infty} C(x,0) dx$$

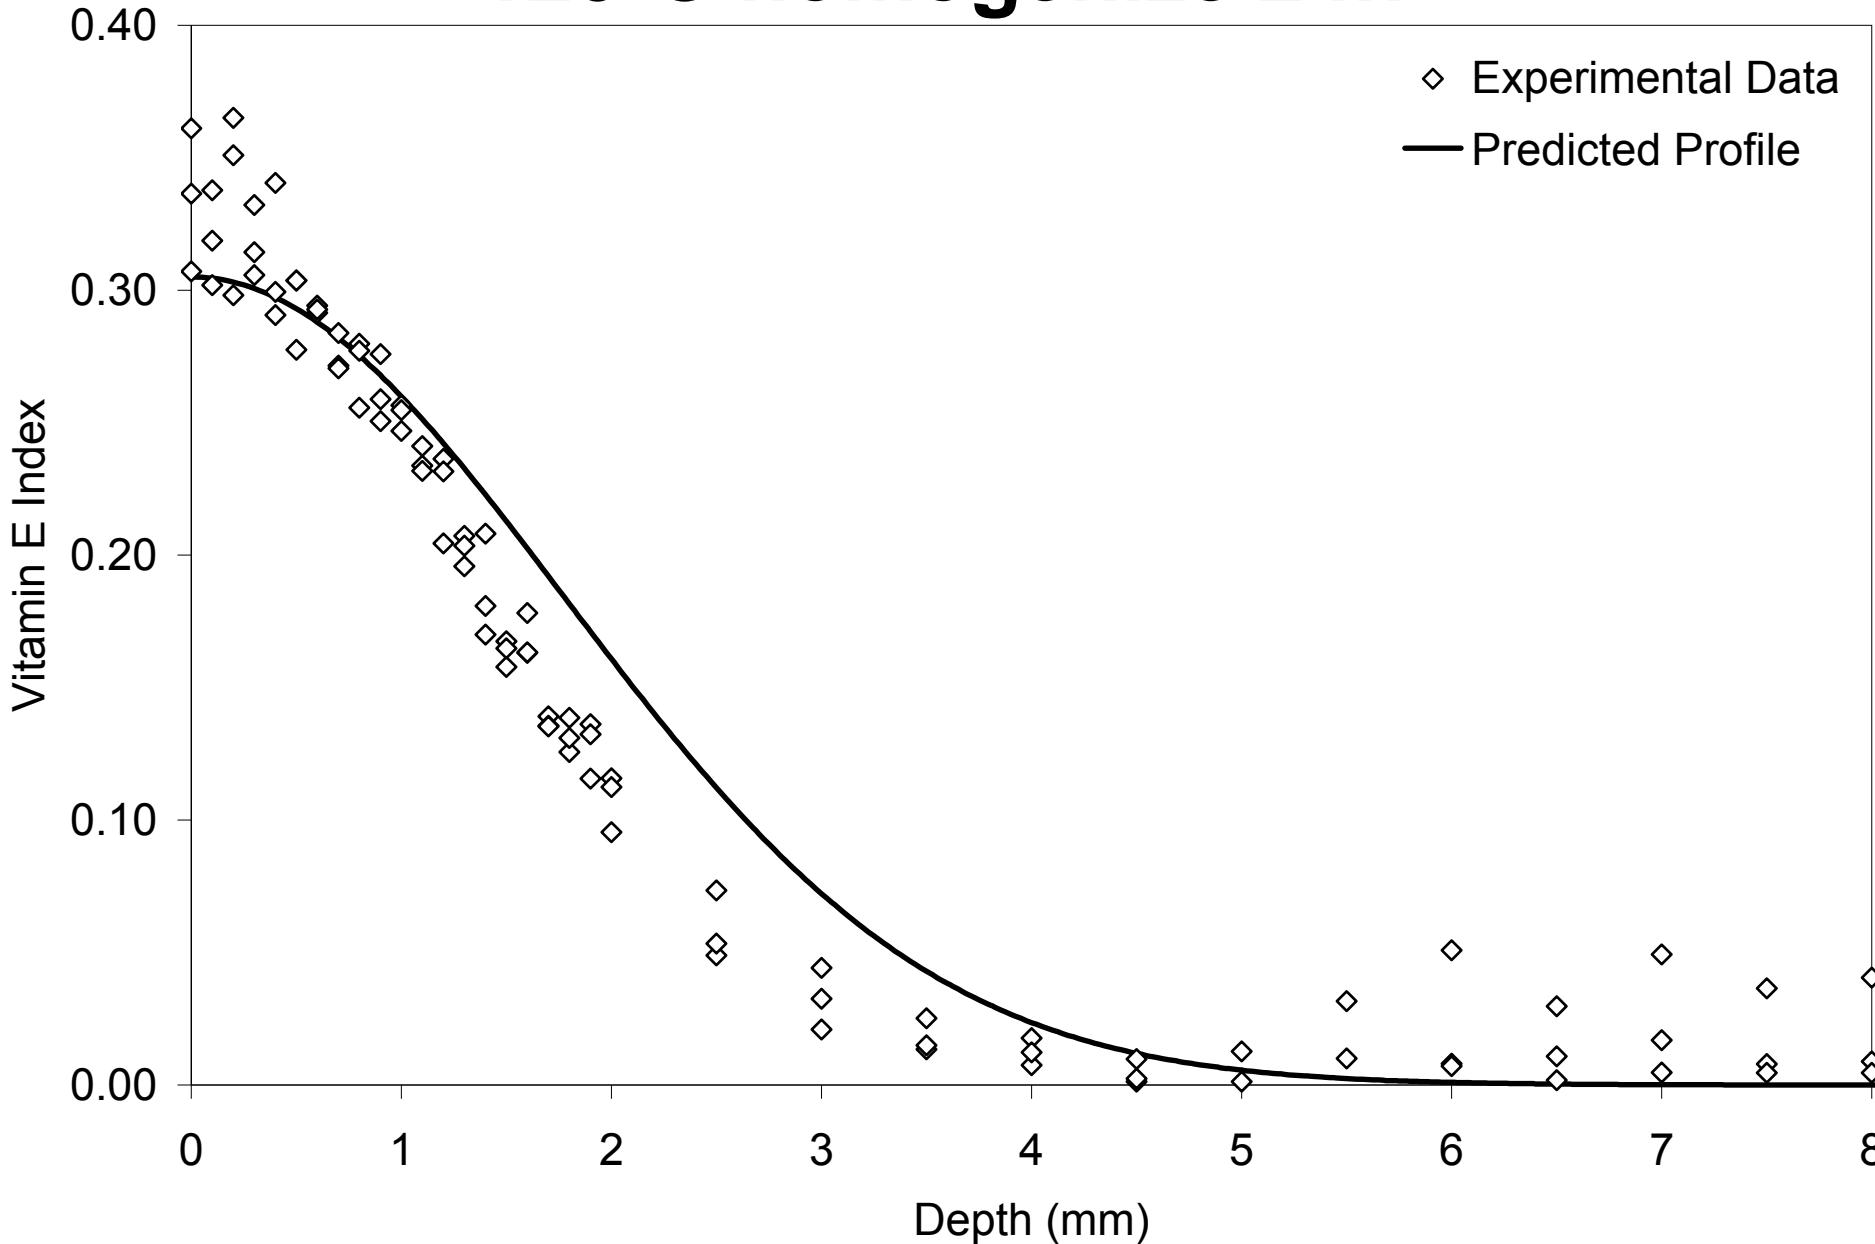

VitE Saturation (C_o) vs. T

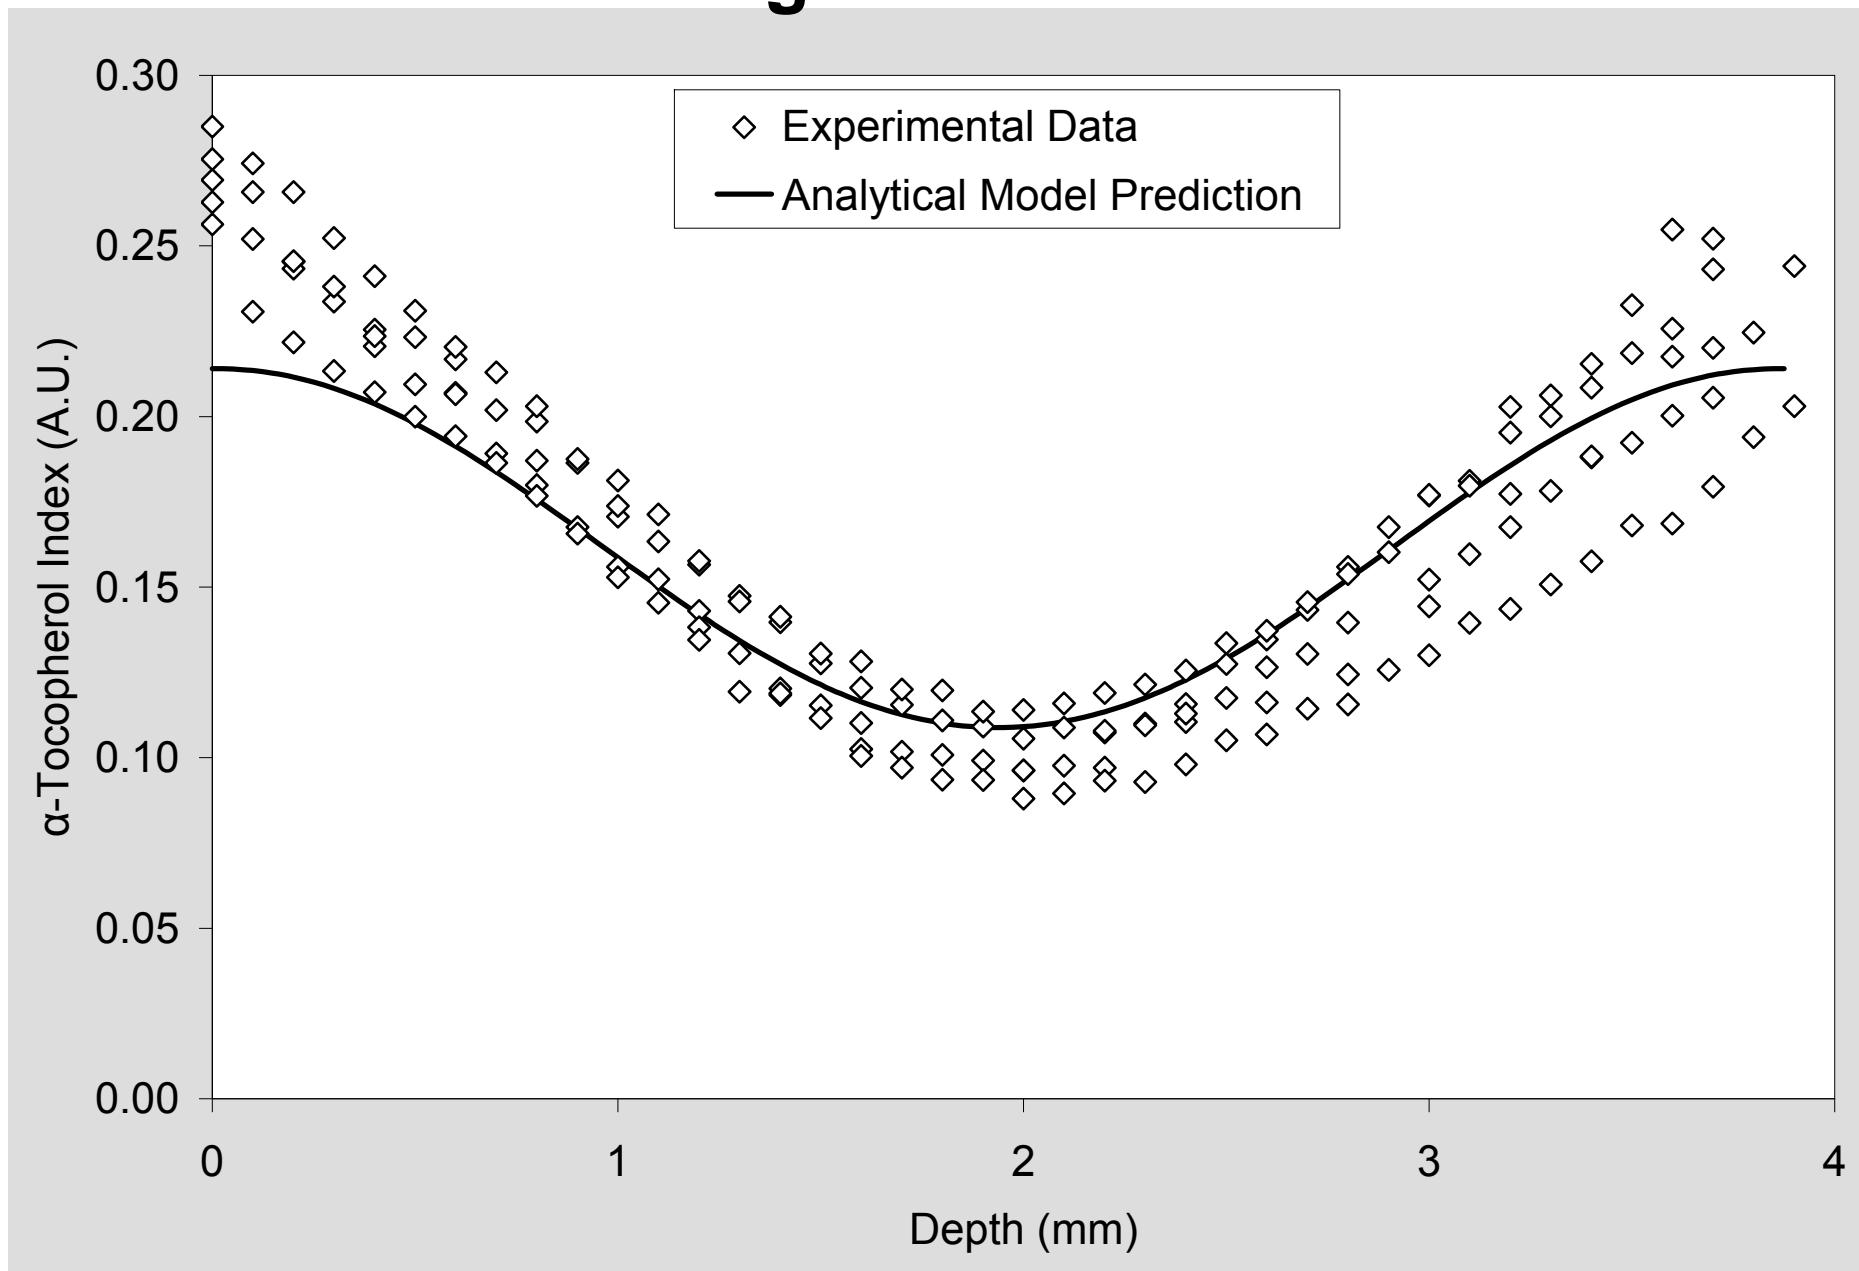

**65kGy UHMWPE 120°C dope 2h +
120°C homogenize 24h**

65kGy UHMWPE 120°C dope 2h + 120°C homogenize 24h

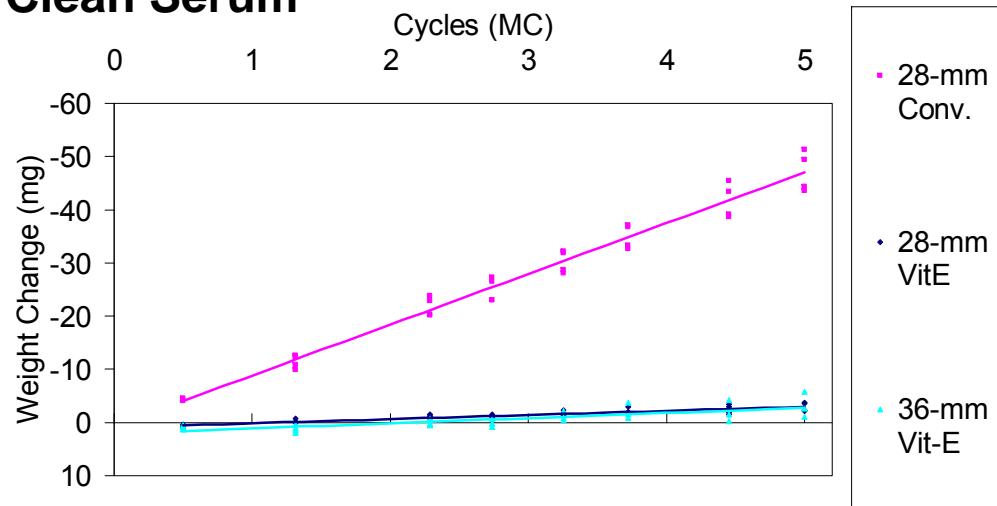

100kGy UHMWPE Dope 120°C 1.5h + homogenize 120°C 16h

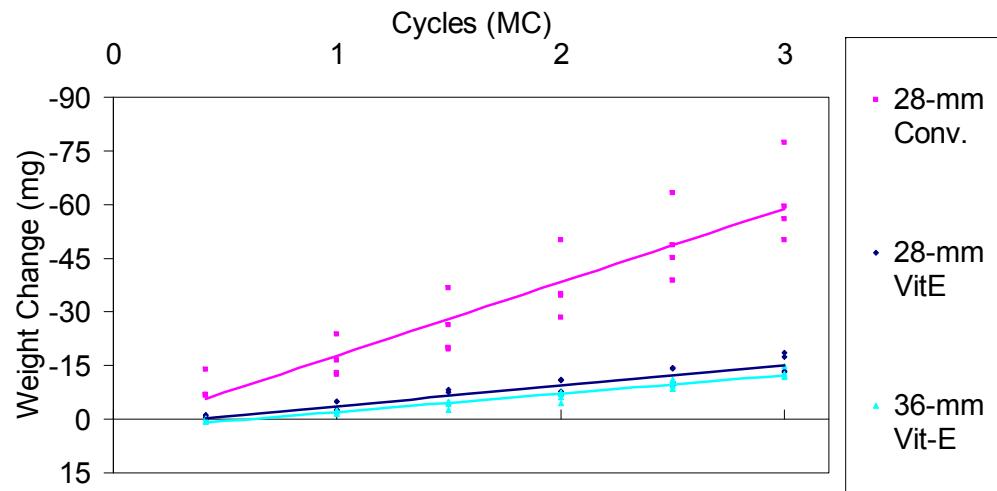

100kGy VitE-UHMWPE (diffused)

Clean Serum

3rd Body Testing

	Clean Wear (mg/MC)	3 rd Body Wear (mg/MC)
28-mm Conventional	10±1	21±3
28-mm Vit-E	1±1	6±2
36-mm Vit-E	1±2	5±3

Elution of Vitamin-E

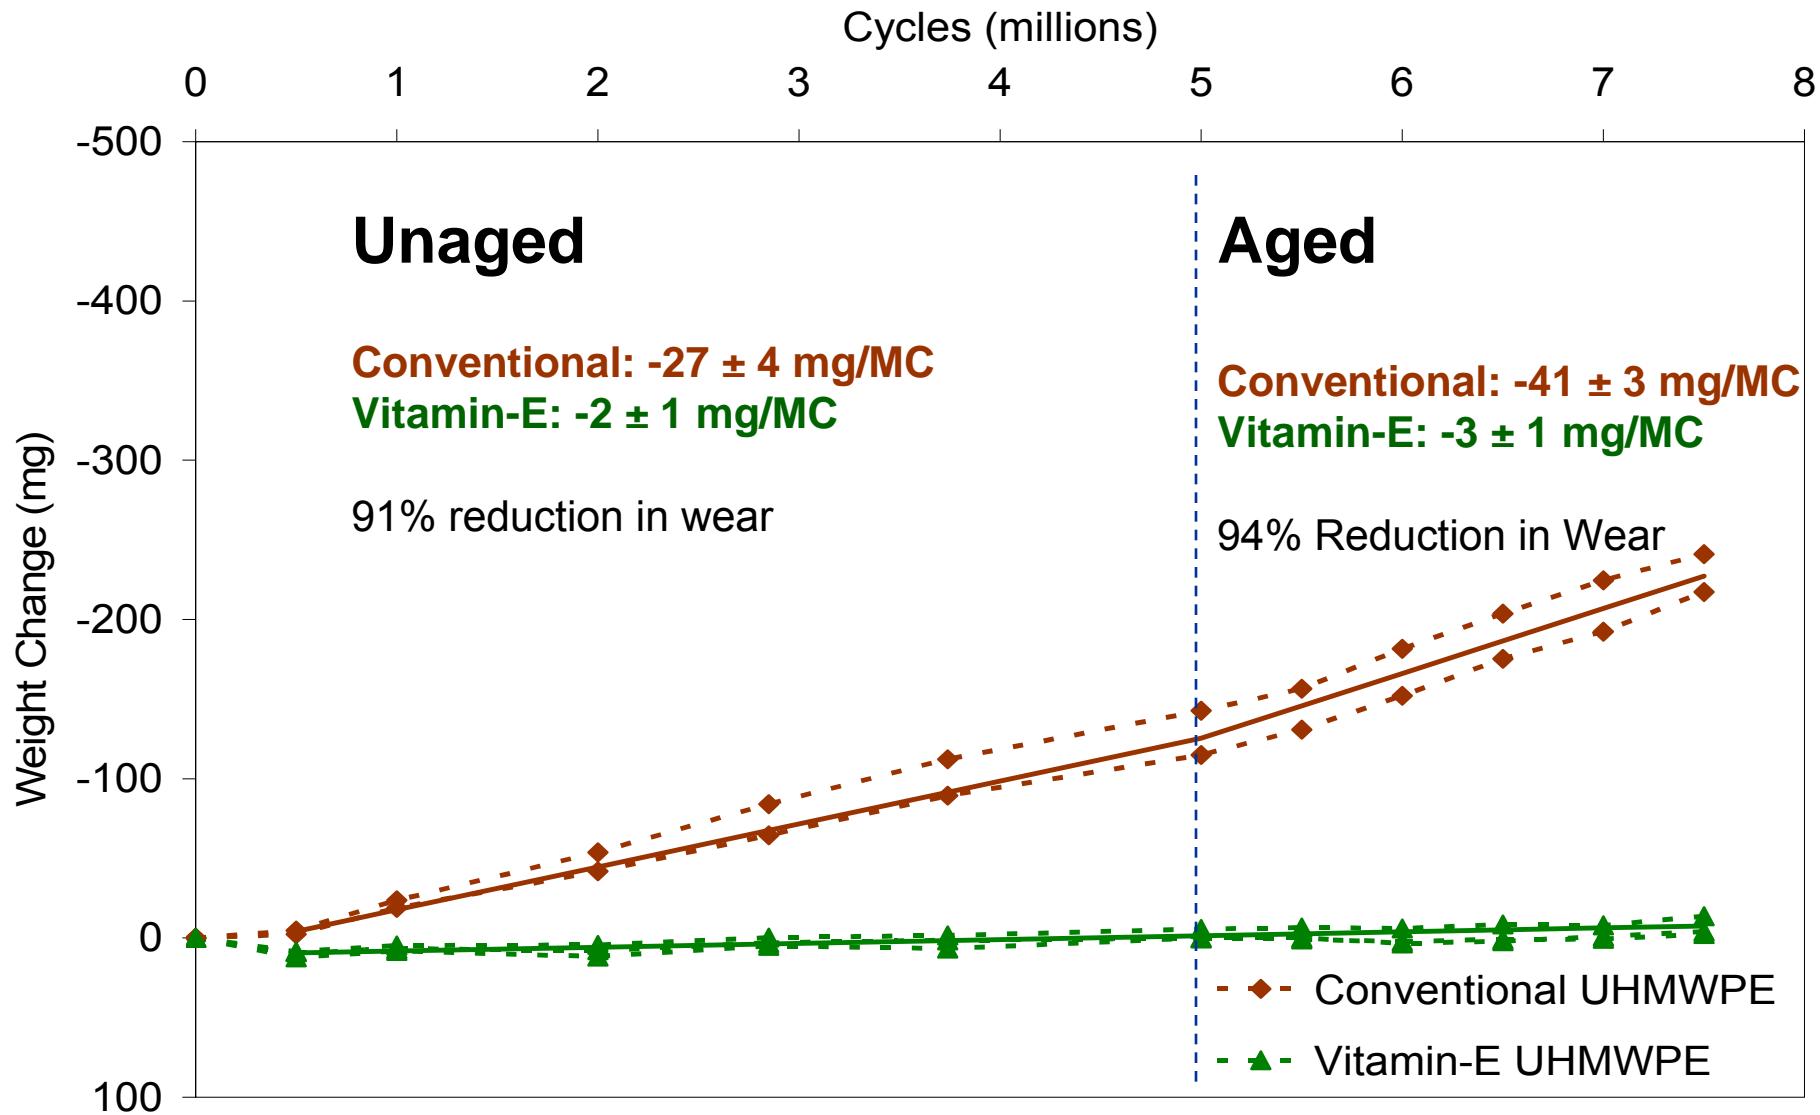

- **Effect on long-term oxidative stability**
 - In vitro forced elution study
 - Joint simulator elution study
- **Local soft tissue response**
 - Rabbit and K9 studies
- **Effect on bony in-growth**
 - K9 total hip study

Elution – Effect of articulation

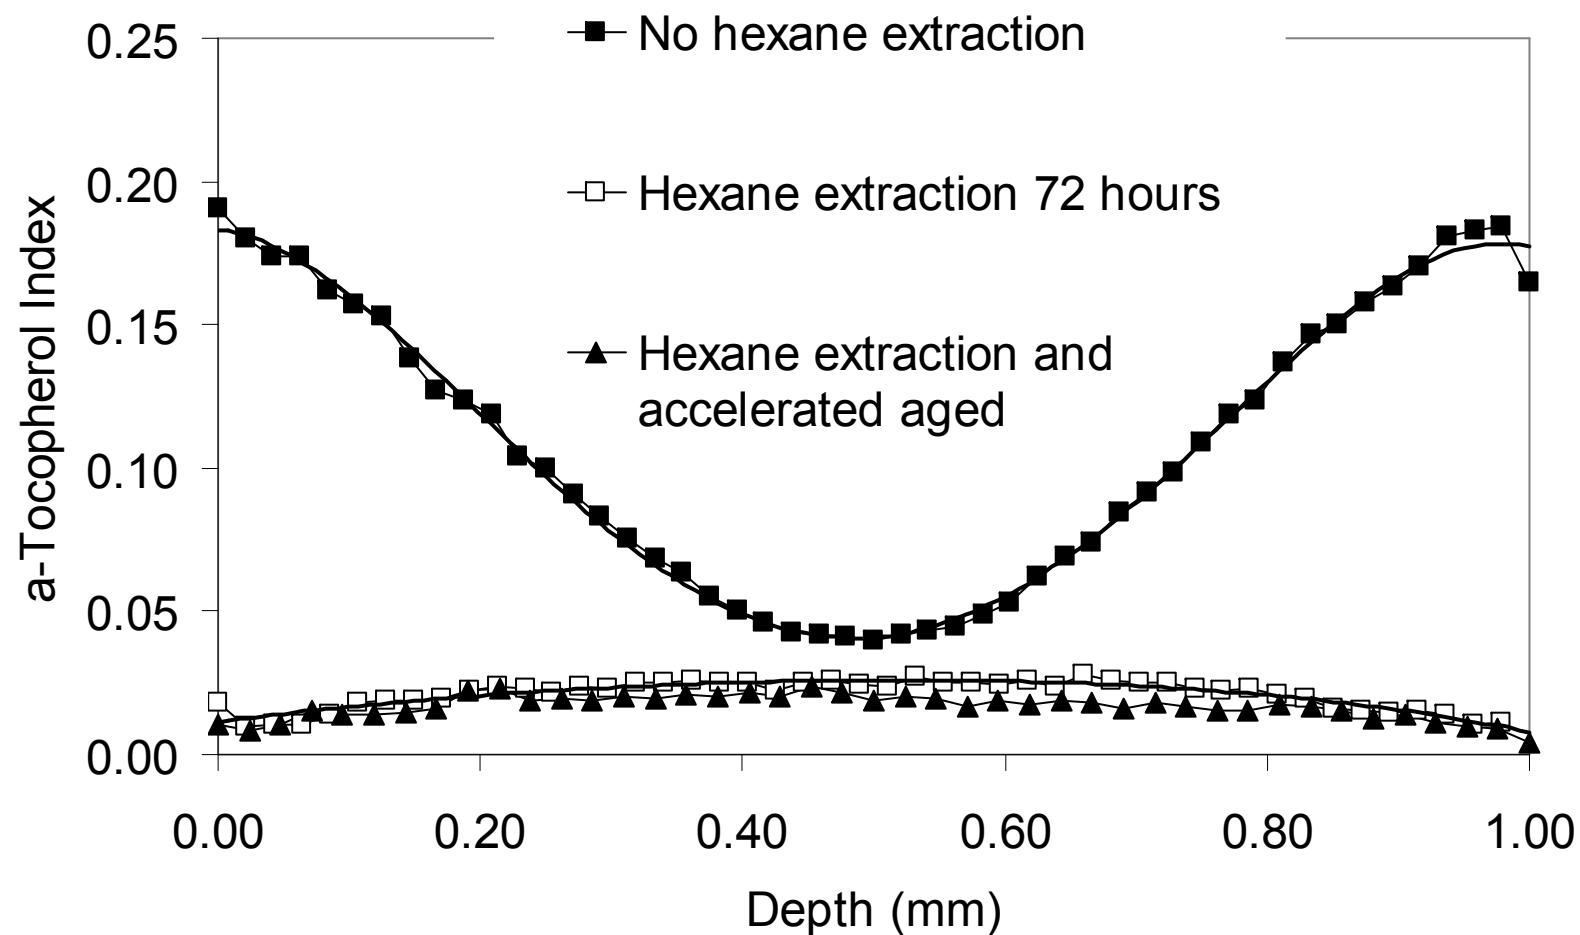

Simulated Hip Wear + Accelerated Aging

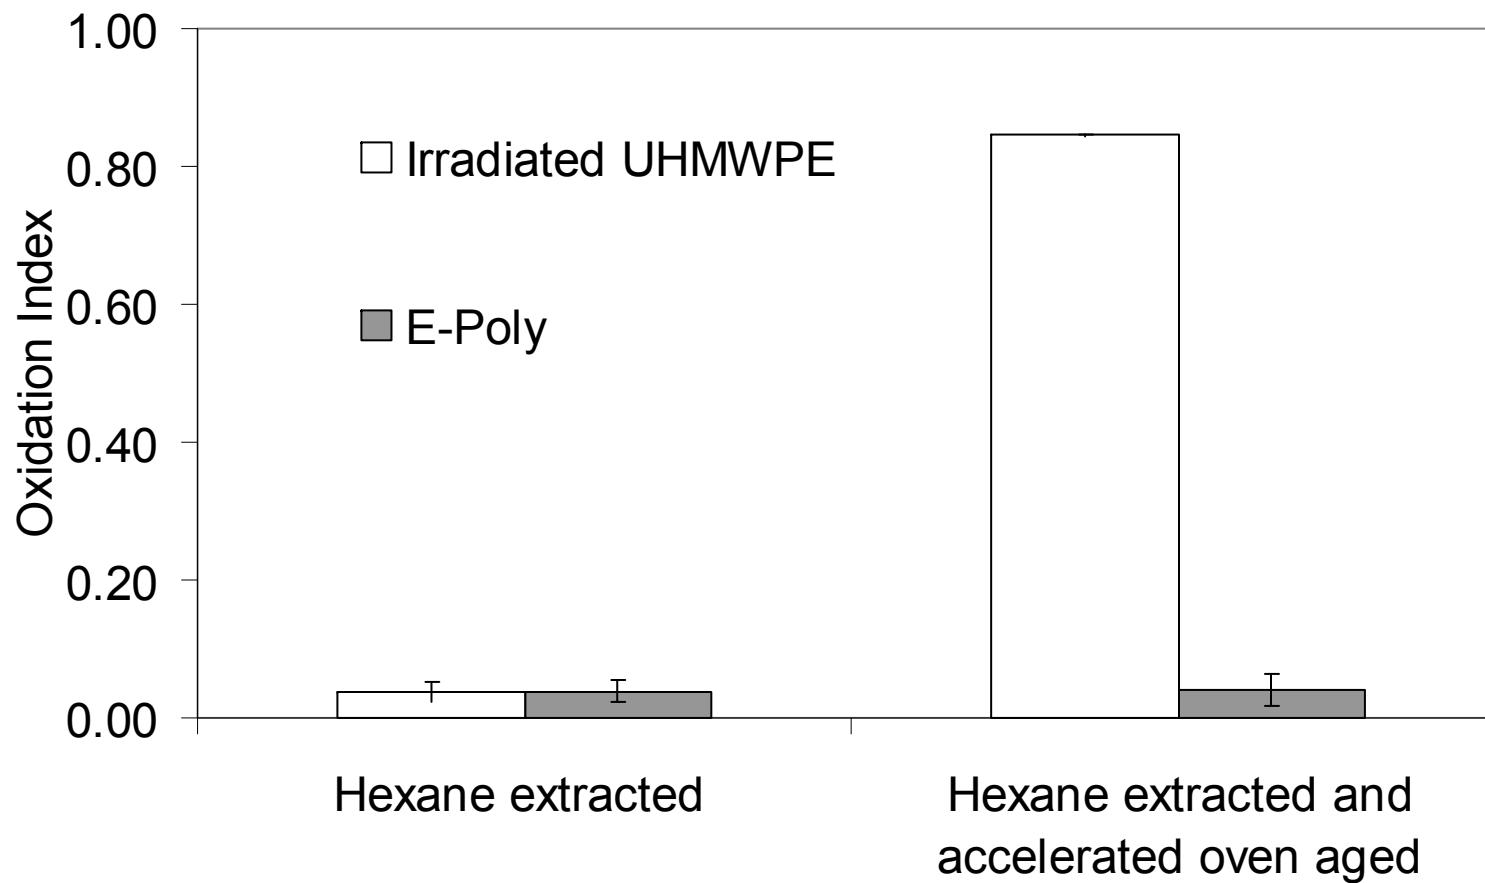

CR Knee 100kGy Vit-E/UHMWPE (diffused)

Forced elution in boiling hexane (72hrs)

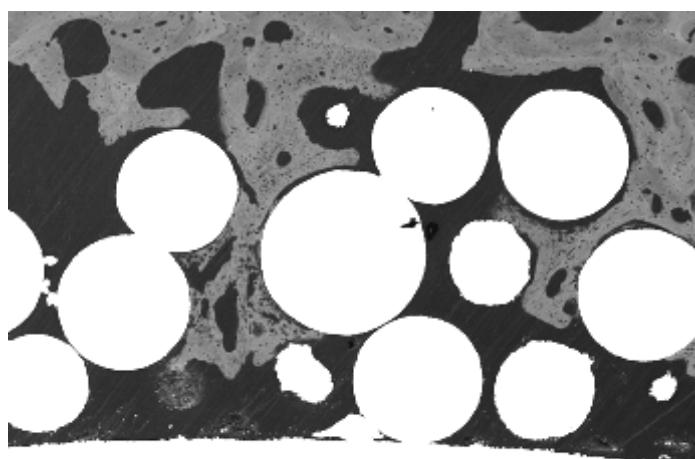

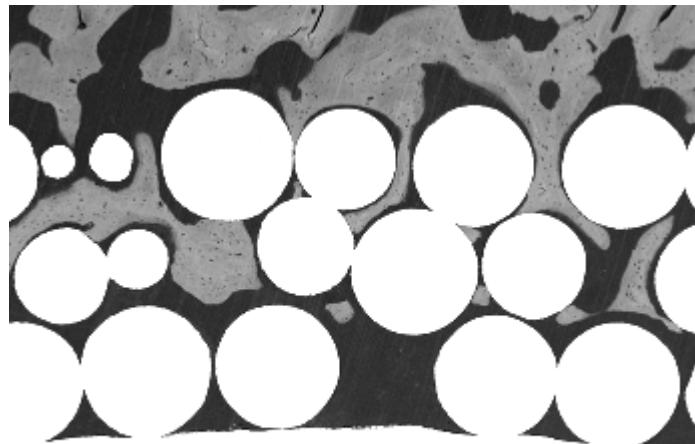

Forced elution: Hexane Extraction + Aging

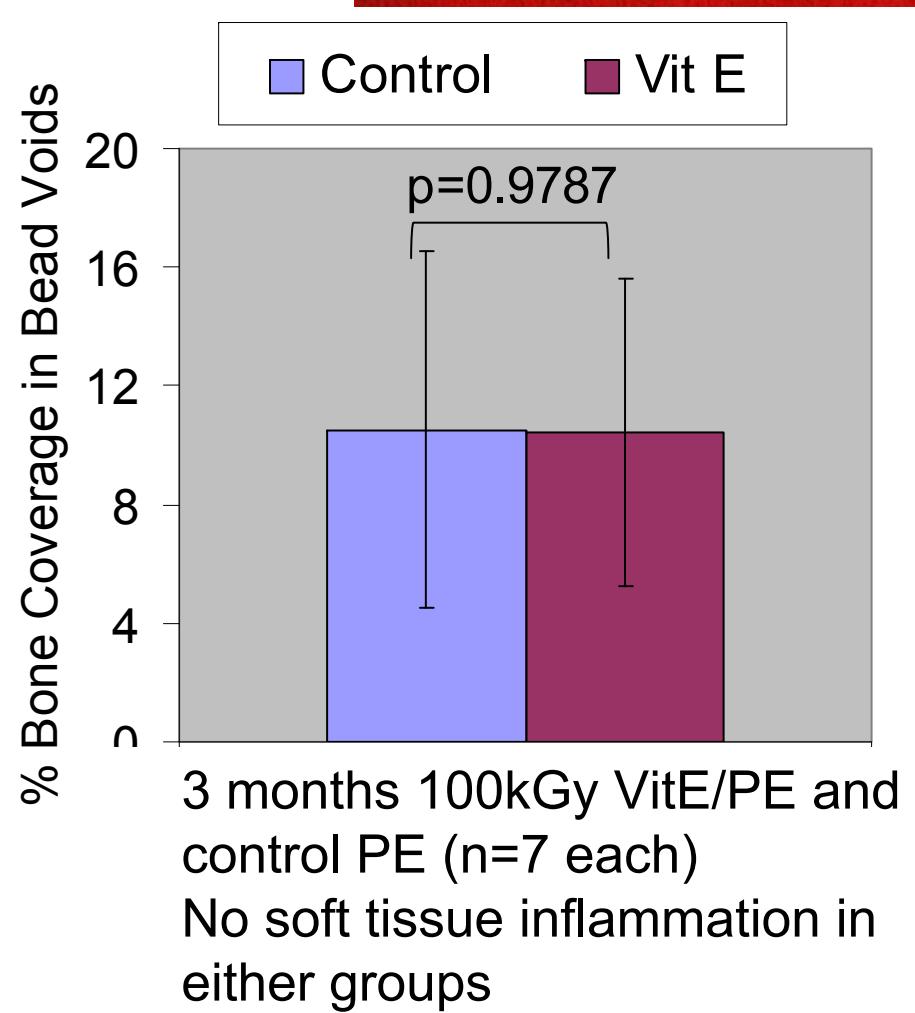

Animal Studies with Vitamin-E

- **Rabbit knee injections**
 - 2 week (n=3) and 12 week (n=6) 10mg of vitE in emulsion or solution; carrier control: no inflammation in soft tissue in either groups
- **Sub-Q plugs in rabbits**
 - 3 and 12 week (n=6) implantation with vitE doped and control plugs of PE
 - both groups showed acute inflammation at 3 weeks and no inflammation at 12 weeks

K9 Total Hip Model Bone In-Growth

H6_09

2nd Generation: Vitamin-E

- **In comparison to 1st generation, goals with 2nd generation were to achieve:**
 - Wear resistance equivalent to 1st generation
 - High oxidative stability
 - Better mechanical properties
 - Better fatigue strength

Fatigue Crack Propagation

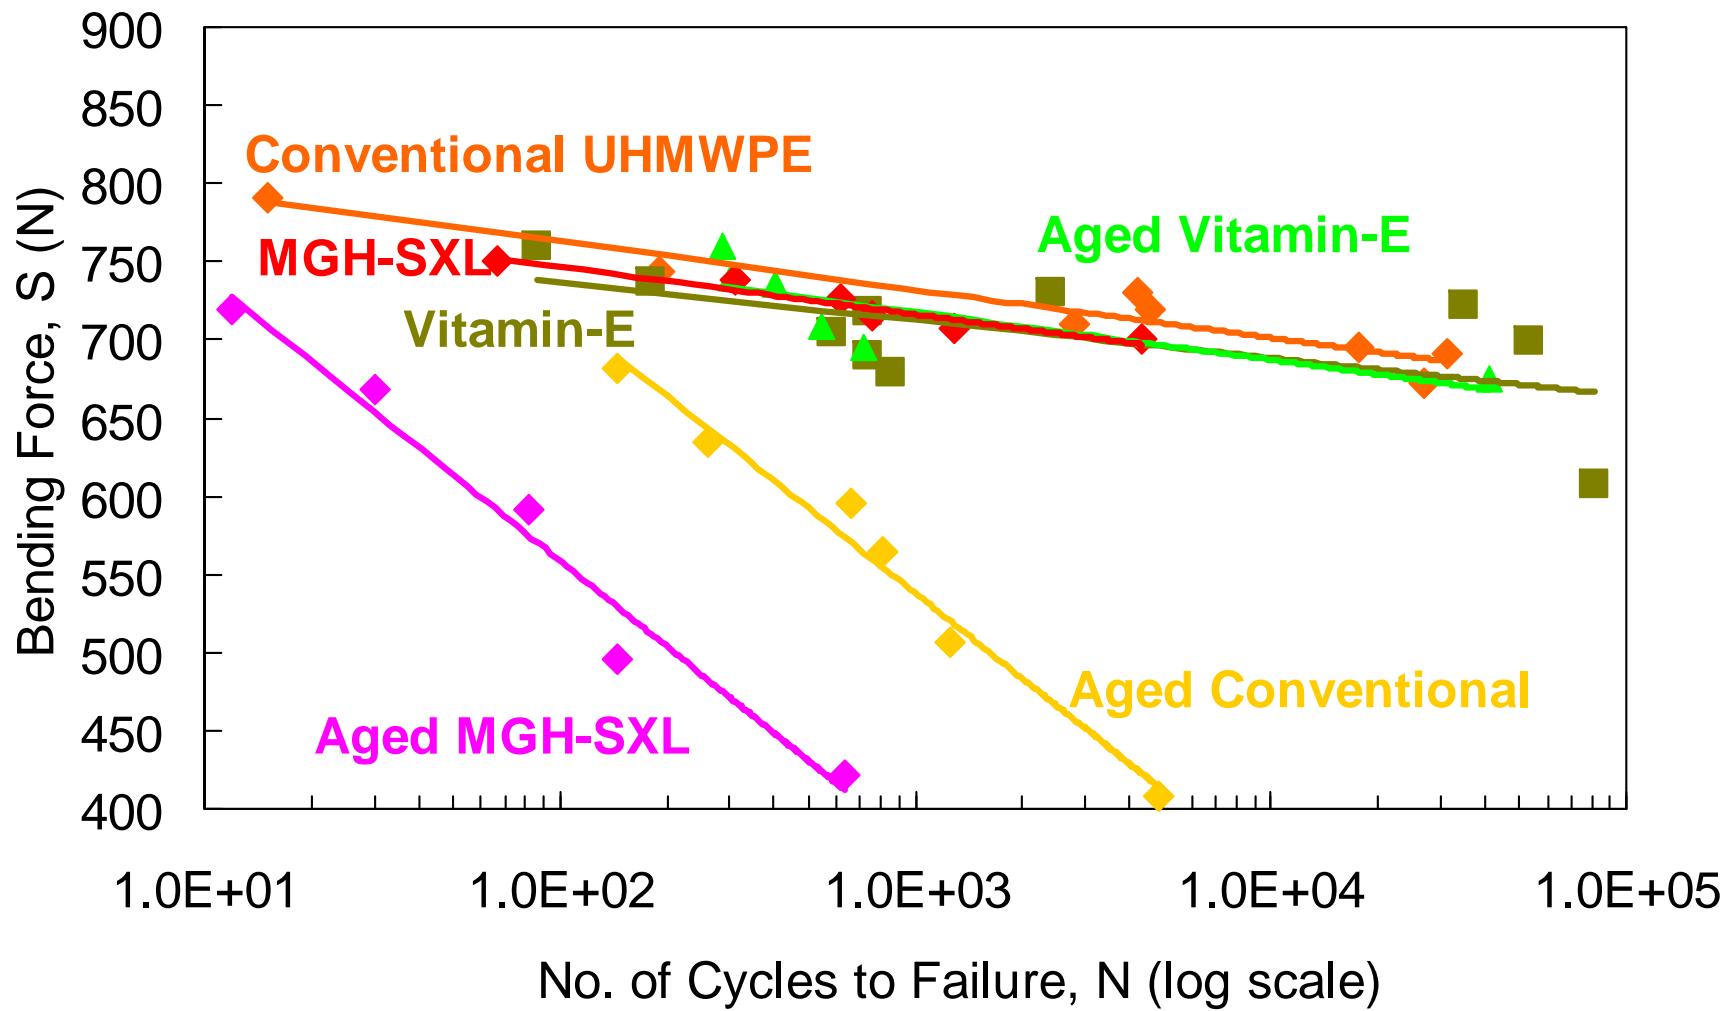

Oxidative Stability: Long Term Aging

Environmental Stress Cracking

Bending Fatigue Comparison

Summary

- **X3**
 - Low wear
 - Contains free radicals
 - Prone to oxidation
 - Long-term performance is questionable due to compromised oxidative stability
- **VitE Stabilized Radiation Crosslinked UHMWPE**
 - Low wear
 - No compromise on oxidation resistance of virgin UHMWPE
 - Higher strength and higher fatigue
 - Suitable for high activity patients and also for more demanding joint implant designs
