Devices; #Homer Stryker Center; ##Stryker Orthopedics**

Introduction

- **Medical grade UHMWPE**
 - No additives
 - Unstabilized
- **Irradiation produces free radicals**
 - Sterilization (25-40 kGy)
 - Enhanced Wear Resistance (50-105 kGy)
- **Free radicals will combine with oxygen**
 - Prior to implantation (“shelf aging”)
 - *In vivo*

Stabilization of UHMWPE

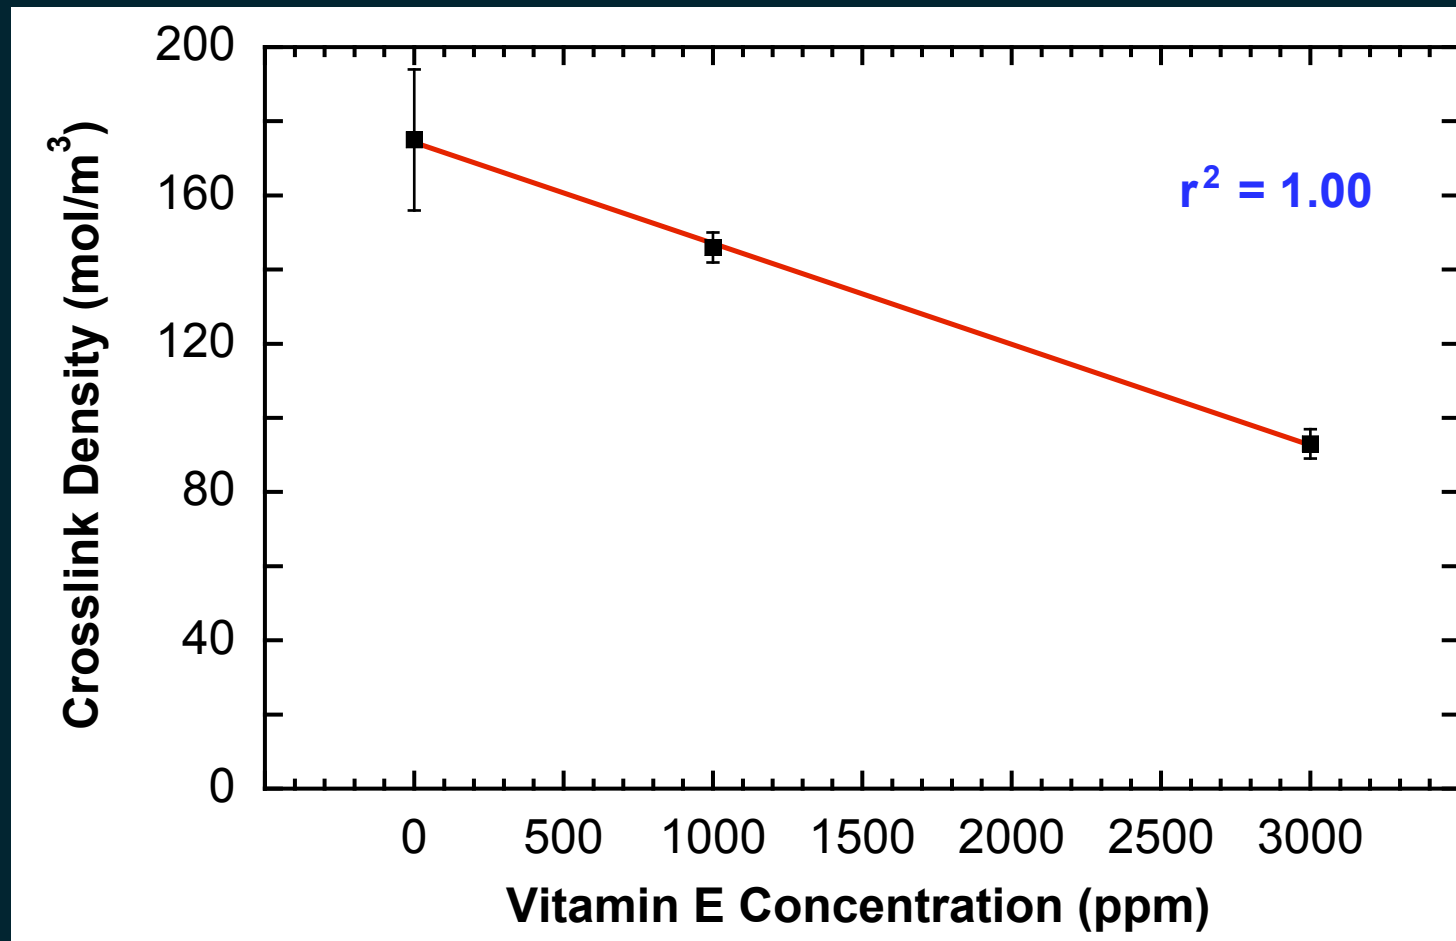

- **Post-irradiation thermal treatment**
 - Remelting
 - Annealing, sequential annealing
- **Mechanically annealing**
- **Vitamin E**
 - Blending
 - Doping

Vitamin E and Medical Grade UHMWPE (500-16,000 ppm)

- **Tomita, Shibata, Mori (1999-2005)**
 - **Kyoto, Japan**
- **Wolf, Lederer**
 - **Leoben, Austria (2002-2006)**
- **Costa, Bracco, Reno**
 - **Torino, Italy (2004-2007 ORS Poster 1780)**
- **Oral, Muratoglu**
 - **Boston, USA (2004-2007 ORS Poster 1626)**

Research Objectives

- **Goal**

- Determine the minimum Vitamin E concentration to stabilize conventional and highly crosslinked UHMWPE

- **Hypothesis**

- Oxidation resistance of Vitamin E blended UHMWPE is influenced by
 - Trace antioxidant concentration (≤ 500 ppm)
 - UHMWPE resin (GUR 1020, 1050)
 - Radiation dose (0, 30, 75 kGy)

Materials

- **GUR 1020 and 1050 PE + vitamin E**
 - Molded by Ticona, ~20 cm in diameter

FTIR

ASTM F2102
Oxidation Index

Mechanical testing
ASTM F2183
Small Punch Test

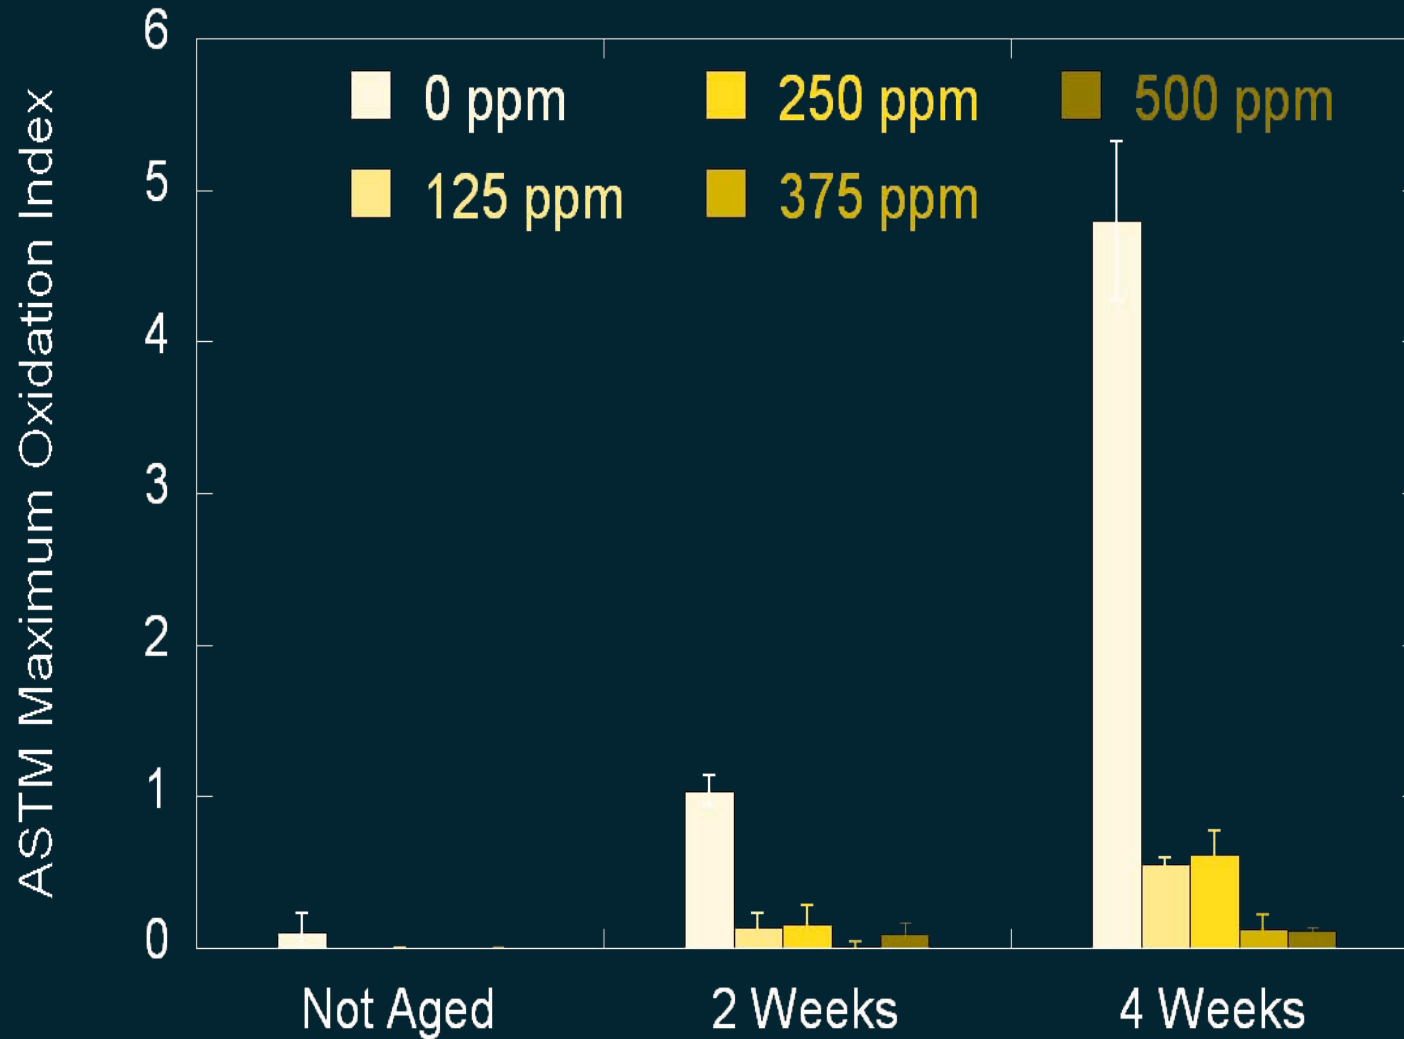

Oxidation Index, Unprocessed PE

Data shown for GUR 1020; GUR 1050 data demonstrated similar trends

Oxidation Index, 30 kGy in N₂

Data shown for GUR 1020; GUR 1050 data demonstrated similar trends

Oxidation Index, 75 kGy + Machined

Data shown for GUR 1020; GUR 1050 data demonstrated similar trends

Mechanical Behavior, 30 kGy in N₂

Effect of Aging (Unstabilized)

Effect of Vitamin E Stabilization

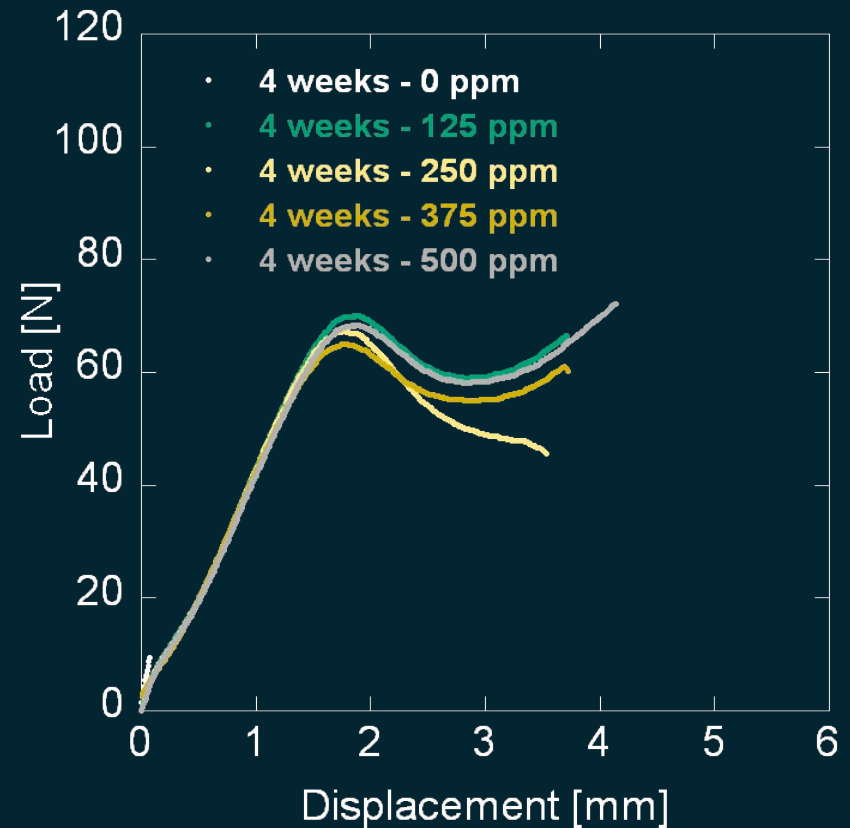

Data shown for GUR 1020; GUR 1050 data demonstrated similar trends

75 kGy + Machining

Effect of Aging (Unstabilized)

Effect of Vitamin E Stabilization

Data shown for GUR 1020; GUR 1050 data demonstrated similar trends

Ultimate Load, 75 kGy + Machining

* P < 0.05 when compared with non-aged

Discussion

- **Only trace concentrations of Vitamin E needed to stabilize irradiated UHMWPE**
- **Minimum Vitamin E concentration**
 - **Insensitive to resin**
 - **Sensitive to radiation treatment**
 - **Sensitive to oxidative challenge**

Conclusion

- High levels of Vitamin E not necessary to stabilize irradiated UHMWPE
- Trace levels of Vitamin E (≤ 500 ppm) may not substantially compromise crosslinking
 - Hardening behavior during small punch test
 - Oral et al. (2005)
